LGA Infants >90th percentile	Maternal DM Racial or familial factors Increasing parity Previous LGA infant, high BMI, large pregnancy weight gain Certain syndromes	Birth trauma, perinatal depression (meconium aspiration) RDS, TTN Jaundice, polycythemia Hypoglycemia, hypocalcemia

Dubowitz/Ballard Scores

GA can be determined after birth using Dubowitz/Ballard scores:

- Assessment at delivery of physical maturity (e.g. plantar creases, lanugo, ear maturation) and neuromuscular maturity (e.g. posture, arm recoil) translates into a score from -10 to +50
- Higher score means greater maturity (increased GA)
- -10 = 20 wk; +50 = 44 wk
- Ideal = 35-40, which corresponds to GA 38-40 wk
- Only accurate ± 2 wk

Routine Neonatal Care

1. erythromycin ointment: applied to both eyes for prophylaxis of ophthalmia neonatorum (of questionable efficacy)
2. vitamin K IM: prophylaxis against HDNB
3. newborn screening tests in Ontario
 - in Ontario, newborn screening tests for
 - metabolic disorders (amino acid disorders, organic acid disorders, fatty acid oxidation defects, biotinidase deficiency, galactosemia)
 - blood disorders (SCD, other hemoglobinopathies)
 - endocrine disorders (CAH, congenital hypothyroidism)
 - others (CF, severe combined immunodeficiency)
 - congenital hearing loss
4. if mother Rh negative: send cord blood for blood group and direct antiglobulin test
5. if mother hepatitis B surface antigen positive: HBIG and start hepatitis B vaccine series

Neonatal Resuscitation

- assess Apgar score at 1 and 5 min
- if <7 at 5 min then reassess q5min, until >7
- do not wait to assign Apgar score before initiating resuscitation

Table 23. Apgar Score

Sign	0	1	2
Heart Rate	Absent	<100/min	> 100/min
Respiratory Effort	Absent	Slow, irregular	Good, crying
Irritability	No response	Grimace	Cough/cry
Tone	Limp	Some flexion of extremities	Active motion
Colour	Blue, pale	Body pink, extremities blue (acrocyanosis)	Completely pink

Initial Resuscitation

- anticipation: know maternal history, history of pregnancy, labour, and delivery
- steps to take for all infants
 - warm (radiant heater, warm blankets) and dry the newborn (remove wet blankets)
 - position and clear airway (“sniffing” position)
 - stimulate infant: rub lower back gently or flick soles of feet EXCEPT if meconium present (in which case tracheal suction first)
 - assess breathing and heart rate

Table 24. Interventions Used in Neonatal Resuscitation

Intervention	Schedule	Indications	Comments
Epinephrine (adrenaline)	0.1-0.3 mL/kg/dose of 1:10,000 (0.01-0.03 mg/kg) IV 0.5-1 mL/kg/dose of 1:10,000 (0.05-0.1 mg/kg) endotracheally can be considered while awaiting IV access (IV preferred) Can be repeated q3-5 min prn	HR <60 and not rising	Side effects: tachycardia, HTN, cardiac arrhythmias
Fluid Bolus (NS, whole blood, Ringer’s lactate)	10 mL/kg May need to be repeated Avoid giving too rapidly as large volume rapid infusions can be associated with IVH	Evidence of hypovolemia	

Approach to the Depressed Newborn

- a depressed newborn lacks one or more of the following characteristics of a normal newborn
 - pulse >100 bpm
 - cries when stimulated
 - actively moves all extremities
 - has a good strong cry
- approximately 10% of newborn babies require assistance with breathing after delivery

Table 25. Etiology of Respiratory Depression in the Newborn

Etiology	Examples
Respiratory Problems	RDS/hyaline membrane disease Pulmonary hypoplasia CNS depression MAS Pneumonia Pneumothorax Pleural effusions Congenital malformations
Anemia (severe)	Erythroblastosis fetalis Secondary hydrops fetalis
Maternal Causes	Drugs/anesthesia (opiates, magnesium sulphate) DM Maternal myasthenia gravis
Congenital Malformations/Birth Injury	Nuchal cord, perinatal depression Bilateral phrenic nerve injury Potter’s sequence
Shock	Antepartum hemorrhage
CHD	Transposition of the great arteries with intact ventricular septum
Other	Hypothermia Hypoglycemia Infection

Apgar Score

- Appearance (colour)
- Pulse (heart rate)
- Grimace (irritability)
- Activity (tone)
- Respiration (respiratory effort)
- Or: “How Ready Is This Child?”

Use of 100% Oxygen in Neonatal Resuscitation

Wyckoff MH, Aziz K, Escobedo MB, Kapadia VS, Kattwinkel J, Perlman JM, Simon WM, Weiner GM, Zaichkin, JG. Part 13: neonatal resuscitation: 2015 American Heart Association Guidelines Update for Cardiopulmonary Resuscitation and Emergency Cardiovascular Care. *Circulation* 2015;132(suppl 2):S543–S560.

Findings from animal and theoretical studies have suggested potential adverse effects with the administration of 100% oxygen. However, given available data is limited in general and only obtained from newborn samples, the 2015 neonatal resuscitation guidelines have provided the following recommendation: “Since an oxygen saturation of 100% may correspond to a PaO₂ anywhere between ~80 and 500 mm Hg, in general it is appropriate to wean the FIO₂ for a saturation of 100%, provided the oxyhemoglobin saturation can be maintained ≥94%.” (Class IIb, LOE C).

Corrective Actions for PPV in Neonatal Resuscitation

- MR SOPA
- Mask readjustment
- Reposition airway
- Suction mouth and nose
- Open mouth
- Pressure increase
- Alternative airway

Targeted Preductal SpO₂ After Birth

- 1 min 60-65%
- 2 min 65-70%
- 3 min 70-75%
- 4 min 75-80%
- 5 min 80-85%
- 10 min 85-95%

Diagnosis

- vital signs
- detailed maternal history: include prenatal care, illnesses, use of drugs, labour, previous high risk pregnancies, infections during pregnancy, current infections, duration of ruptured membranes, blood type and Rh status, amniotic fluid status, GA, meconium, Apgar scores
- clinical findings (observe for signs of respiratory distress such as cyanosis, tachypnea, retractions, grunting, temperature instability)
- laboratory results (CBC, ABG, blood type, glucose)
- transillumination of chest to evaluate for pneumothorax
- CXR

Management

- *see Neonatal Resuscitation, P59*, identify and treat underlying cause

Common Conditions of Neonates

Apnea

Definition

- “periodic breathing”: normal respiratory pattern seen in newborns in which periods of rapid respiration are alternated with pauses lasting 5-10 s
- “apnea”: absence of respiratory gas flow for >20 s (or less if associated with bradycardia or desaturation)
 - 3 types:
 - central: no chest wall movement, no signs of obstruction
 - obstructive: chest wall movement continues against obstructed upper airway, no airflow
 - mixed: combination of central and obstructive apnea

Differential Diagnosis

- in term infants, apnea requires full workup as it can be associated with sepsis
- other causes
 - CNS
 - apnea of prematurity (<34 wk): combination of CNS immaturity and obstructive apnea; resolves by 36 wk GA; diagnosis of exclusion
 - seizures
 - ICH
 - hypoxic injury
 - infectious: sepsis, meningitis, NEC
 - GI: GERD, aspiration with feeding
 - metabolic: hypoglycemia, hyponatremia, hypocalcemia, inborn error of metabolism
 - cardiovascular: anemia, hypovolemia, PDA, heart failure
 - medications: morphine

Management

- O₂, ventilatory support, maintain normal blood gases
- tactile stimulation
- correct underlying cause
- medications: methylxanthines (caffeine) stimulate the CNS and diaphragm and are used for apnea of prematurity (not in term infants)

Bleeding Disorders in Neonates

Clinical Presentation

- oozing from the umbilical stump, excessive bleeding from peripheral venipuncture/heel stick sites/IV sites, large caput succedaneum, cephalohematomas (in absence of significant birth trauma), subgaleal hemorrhage and prolonged bleeding following circumcision

Etiology

- 4 major categories
 - increased platelet destruction: maternal ITP or SLE, infection/sepsis, DIC, neonatal alloimmune thrombocytopenia, autoimmune thrombocytopenia
 - decreased platelet production/function: pancytopenia, bone marrow replacement, Fanconi anemia, Trisomy 13 and 18
 - metabolic: congenital thyrotoxicosis, inborn error of metabolism
 - coagulation factor deficiencies (*see Hematology, H31*): hemophilia A/B, HDNB

NEONATAL ALLOIMMUNE THROMBOCYTOPENIA

Epidemiology

- 1 per 4,000-5,000 live births

Pathophysiology

- platelet equivalent of Rh disease of the newborn
- occurs when mother is negative for HPA and fetus is positive
- development of maternal IgG antibodies against HPA antigens on fetal platelets

Clinical Presentation

- petechiae, purpura, thrombocytopenia in otherwise healthy neonate
- severe disease can lead to intracranial bleeding

Diagnosis

- maternal and paternal platelet typing and identification of platelet alloantibodies

Treatment

- IVIg to mother prenatally starts in second trimester ± steroids ± fetal platelet transfusions
- treat neonate with IVIg
- if transfusion required should be with washed maternal platelets or donor HPA negative platelets

AUTOIMMUNE THROMBOCYTOPENIA

Pathophysiology

- caused by antiplatelet antibodies from maternal ITP or SLE
- passive transfer of antibodies across placenta

Clinical Presentation

- similar presentation to neonatal alloimmune thrombocytopenia, but thrombocytopenia usually less severe

Treatment

- steroids to mother for 10-14 d prior to delivery or IVIg to mother before delivery
- treat neonate with IVIg (usually if platelets <60,000)
- transfusion of infant with maternal/donor platelets only in severe cases, as antibodies will destroy transfused platelets

HEMORRHAGIC DISEASE OF THE NEWBORN

Pathophysiology

- caused by vitamin K deficiency
- factors II, VII, IX, X are vitamin K-dependent, therefore both PT and PTT are abnormal

Etiology and Clinical Presentation

- neonates at risk of vitamin K deficiency if: vitamin K poorly transferred across the placenta; maternal use of antiepileptics; insufficient bacterial colonization of colon at birth to synthesize vitamin K; breastfed (vitamin K intake inadequate in breastfed infants)
 - vitamin K poorly transferred across the placenta
 - insufficient bacterial colonization of colon at birth to synthesize vitamin K
 - vitamin K intake inadequate in breastfed infants
 - maternal use of antiepileptics is an additional risk factor
- neonate may present with hematomas, ICH (causing apnea or seizures), internal bleeding, hematuria, bruising, prolonged bleeding (often from mucous membranes, umbilicus, circumcision, and venipunctures)

Prevention

- vitamin K IM administration at birth to all newborns

Bronchopulmonary Dysplasia

Definition

- also known as chronic lung disease
- clinically defined as O₂ requirement for >28 d plus persistent need for oxygen and/or ventilatory support at 36 wk corrected GA
- damage to developing lungs with prolonged intubation/ventilation, high levels O₂, infections

Investigations

- CXR findings may demonstrate decreased lung volumes, areas of atelectasis, signs of inflammation, and hyperinflation

Treatment

- no good treatments
- gradual wean from ventilator, optimize nutrition
- dexamethasone may help decrease inflammation and encourage weaning, but use of dexamethasone is associated with increased risk of adverse neurodevelopmental outcomes

Prognosis

- chronic respiratory failure may lead to pulmonary HTN, poor growth, and right-sided heart failure
- patients with bronchopulmonary dysplasia may continue to have significant impairment and deterioration in lung function late into adolescence
- some lung abnormalities may persist into adulthood including airway obstruction, airway hyper-reactivity, and emphysema
- associated with increased risk of adverse neurodevelopmental outcomes

Cyanosis

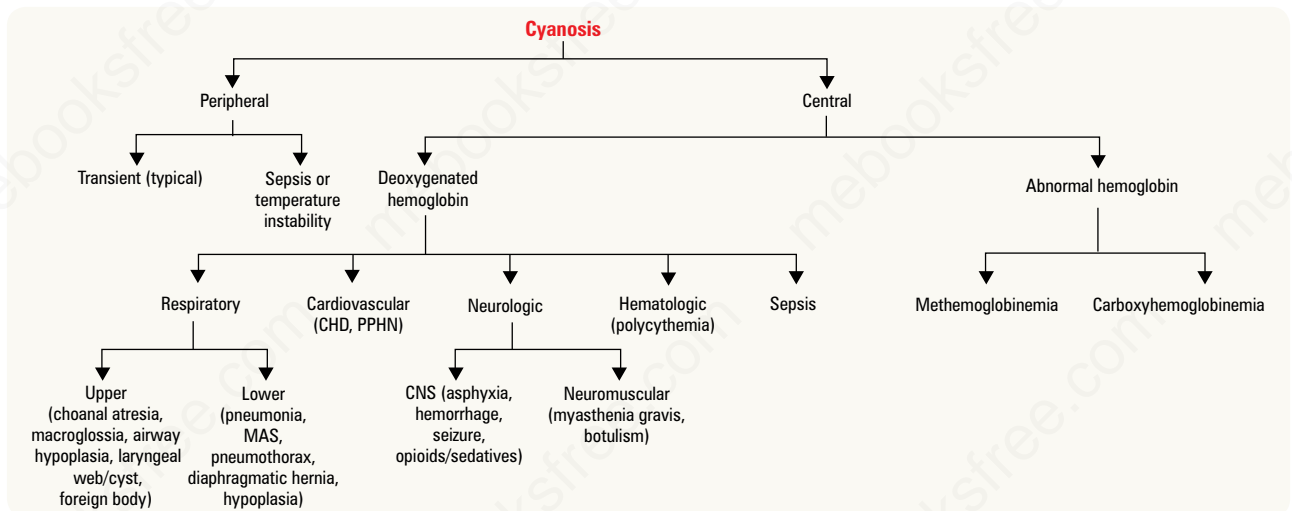

Figure 12. Approach to neonatal cyanosis

Management

- ABGs
 - elevated CO_2 suggests respiratory cause
 - hyperoxia test (to distinguish between cardiac and respiratory causes of cyanosis): get baseline PaO_2 in room air, then PaO_2 on 100% O_2 for 10-15 min
 - ♦ $\text{PaO}_2 < 150$ mmHg: suggests cyanotic CHD or possible PPHN (see *Cardiology, P16*)
 - ♦ $\text{PaO}_2 > 150$ mmHg: suggests cyanosis likely due to respiratory or non-cardiac cause
- CXR: look for respiratory abnormalities (pneumothorax, respiratory tract malformations, evidence of shunting, pulmonary infiltrates) and cardiac abnormalities (cardiomegaly, abnormalities of the great vessels)

Carboxyhemoglobinemia (secondary to carbon monoxide poisoning) results in impaired binding of oxygen to hemoglobin but does not discolour the blood. Therefore it may not register on pulse oximetry and cyanosis may not be evident clinically

Methemoglobinemia typically reads higher on pulse oximetry than the true level of oxyhemoglobin. Methemoglobin alters the absorption of red light at the two wavelengths that pulse oximetry uses to predict oxygen saturation

Diaphragmatic Hernia

- see [General Surgery, GS62](#)

Definition

- developmental defect of the diaphragm with herniation of abdominal organs into thorax
- associated with pulmonary hypoplasia and PPHN

Clinical Presentation

- respiratory distress, cyanosis
- scaphoid abdomen and barrel-shaped chest
- affected side dull to percussion and breath sounds absent, may hear bowel sounds instead
- heart sounds shifted to contralateral side
- asymmetric chest movements, trachea deviated away from affected side
- may present outside of neonatal period
- often associated with other anomalies (cardiovascular, CNS, chromosomal abnormalities)
- CXR: bowel loops in thorax (usually left side), displaced mediastinum

Treatment

- immediate intubation required at birth: DO NOT bag mask ventilate because air will enter stomach and further compress lungs
- place large bore orogastric tube to decompress bowel
- initial stabilization and management of pulmonary hypoplasia and PPHN, hemodynamic support and surgery when stable

Hypoglycemia**Definition**

- glucose <2.6 mmol/L

Etiology

- decreased carbohydrate stores: premature, SGA, RDS, maternal HTN
- endocrine: hormonal deficiencies (GH, cortisol, epinephrine), insulin excess (infant of diabetic mother, Beckwith-Wiedemann syndrome/islet cell hyperplasia), HPA axis suppression (panhypopituitarism)
- inborn errors of metabolism: fatty acid oxidation defects, galactosemia
- miscellaneous: sepsis, hypothermia, polycythemia

Clinical Findings

- signs often non-specific and subtle: lethargy, poor feeding, irritability, tremors, apnea, cyanosis, seizures

Management

- identify and monitor infants at risk (pre-feed blood glucose checks)
- begin oral feeds as soon as possible after birth and ensure regular feeds
- if significant and/or symptomatic hypoglycemia, provide glucose IV and titrate according to blood sugar levels
- if persistent hypoglycemia or no predisposing cause, send "critical blood work" during an episode of hypoglycemia: ABG, ammonia, β -hydroxybutyrate, cortisol, free fatty acids, GH, insulin, lactate, urine dipstick for ketones

Intraventricular Hemorrhage**Definition**

- hemorrhage originating in the periventricular subependymal germinal matrix

Epidemiology

- incidence and severity inversely proportional to GA
- 50% of IVH occurs within 8 h of birth; 90% occurs by day 3

Risk Factors

- prematurity (<32 wk), BW <1,500 g, need for vigorous resuscitation at birth, pneumothorax, ventilated preterm infants, hemodynamic instability, RDS, coagulopathy

Clinical Presentation

- many infants with IVH are asymptomatic
- subtle signs: apnea, bradycardia, changes in tone or activity, altered LOC
- catastrophic presentation: bulging fontanelle, sudden drop in hematocrit, acidosis, seizures, hypotension

Classification

- Papile classification
- parenchymal hemorrhage may also occur in the absence of IVH
- routine head U/S screening of all preterm infants <32 wk or <1,500 g gestation throughout NICU stay
- consider MRI at term for extremely LBW infants

Management of Acute Hemorrhage

- supportive care to maintain blood volume and acid-base status
- avoid fluctuations in blood pressure and cerebral blood flow
- follow-up with serial imaging

Prognosis

- outcome depends on grade of IVH
- short-term sequelae for severe IVH: mortality, extension of bleed, posthemorrhagic hydrocephalus, posthemorrhagic infarction, cyst formation
- possible long-term major neurological sequelae: CP, cognitive deficits, motor deficits, visual and hearing impairment
- Grades I and II hemorrhages have a relatively favourable prognosis
- greatest morbidity and mortality is seen with Grade IV hemorrhage and posthemorrhagic hydrocephalus requiring ventriculoperitoneal shunt placement

**Papile Classification**

- Grade I: germinal matrix hemorrhage
- Grade II: IVH without ventricular dilatation
- Grade III: IVH with ventricular dilatation
- Grade IV: IVH with parenchymal extension

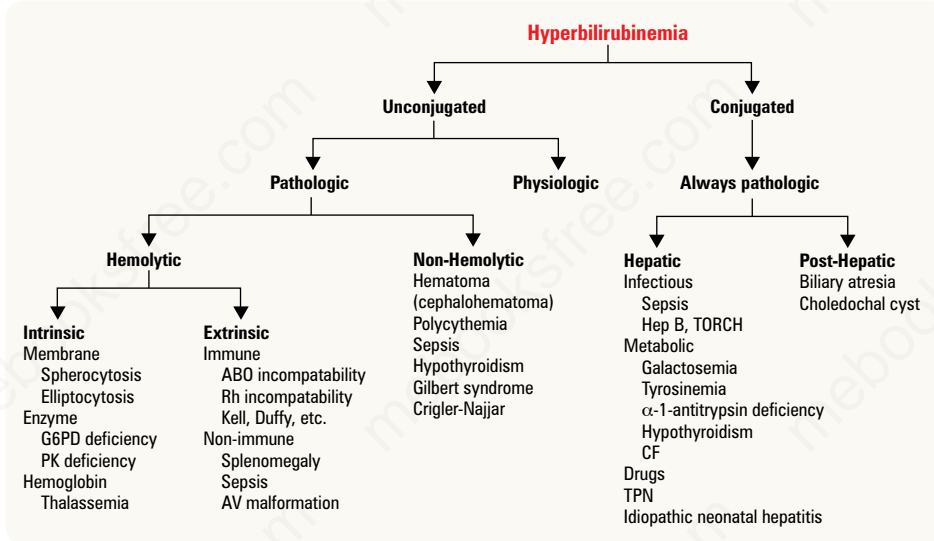

Jaundice

Clinical Presentation

- jaundice is visible at serum bilirubin levels of 85-120 μmol/L; visual assessment is often misleading
- look at sclera, tip of nose in natural light
- jaundice more severe/prolonged (due to increased retention of bilirubin in the circulation) with: prematurity, acidosis, hypoalbuminemia, dehydration, hemolysis

Jaundice is very common – 60% of term newborns develop visible jaundice

Jaundice in the first 24 h of life and conjugated hyperbilirubinemia are always pathological

Jaundice must be investigated if:

- It occurs within 24 h of birth
- Conjugated hyperbilirubinemia is present
- Unconjugated bilirubin rises rapidly or is excessive for patient's age and weight
- Persistent jaundice lasts beyond 1-2 wk of age

Figure 13. Approach to neonatal hyperbilirubinemia

PHYSIOLOGIC JAUNDICE

Epidemiology

- term infants: onset 3-4 d of life, resolution by 10 d of life
- premature infants: higher peak and longer duration

Pathophysiology

- increased hematocrit and decreased RBC lifespan
- immature glucuronyl transferase enzyme system (slow conjugation of bilirubin)
- increased enterohepatic circulation

Breastfeeding Jaundice

- common; due to a lack of milk production → dehydration → exaggerated physiologic jaundice

Breast Milk Jaundice

- 1 per 200 breastfed infants
- glucuronyl transferase inhibitor found in breast milk
- onset 7 d of life, peak at 2-3 wk of life, usually resolved by 6 wk

Table 26. Risk Factors for Jaundice

Maternal Factors	Perinatal Factors	Neonatal Factors
Ethnic group (e.g. Asian, native American) Complications during pregnancy (infant of diabetic mother, Rh or ABO incompatibility) Breastfeeding Family history/previous child required phototherapy	Birth trauma (cephalohematoma, ecchymoses) Prematurity	Difficulty establishing breastfeeding Infection (sepsis, hepatitis) Genetic factors Polycythemia Drugs TPN

Table 27. Causes of Neonatal Jaundice by Age

<24 h	24-72 h	72-96 h	Prolonged (>1 wk)
ALWAYS PATHOLOGIC	Physiologic, polycythemia	Physiologic ± breastfeeding	Breast milk jaundice
Hemolytic	Dehydration	Sepsis	Prolonged physiologic jaundice in preterm
Rh or ABO incompatibility	(breastfeeding jaundice)		Hypothyroidism
Sepsis	Hemolysis		Neonatal hepatitis
Congenital infection (TORCH)	G6PD deficiency		Conjugation dysfunction
Severe bruising/hemorrhage	Pyruvate kinase deficiency		e.g. Gilbert syndrome,
	Spherocytosis		Crigler-Najjar syndrome
	Bruising, hemorrhage, hematoma		Inborn errors of metabolism
	Sepsis/congenital infection		e.g. galactosemia
			Biliary tract obstruction
			e.g. biliary atresia

PATHOLOGIC JAUNDICE

- all cases of conjugated hyperbilirubinemia; some cases of unconjugated hyperbilirubinemia are pathologic

Investigations

- unconjugated hyperbilirubinemia
 - hemolytic workup: CBC, reticulocyte count, blood group (mother and infant), peripheral blood smear, Coombs test
 - if baby is unwell or has fever: septic workup (CBC and differential, blood and urine cultures ± LP, CXR)
 - other: G6PD screen (especially in males), TSH
- conjugated hyperbilirubinemia must be investigated without delay
 - consider liver enzymes (AST, ALT), coagulation studies (PT, PTT), serum albumin, ammonia, TSH, TORCH screen, septic workup, galactosemia screen (erythrocyte galactose-1-phosphate uridylyltransferase levels), metabolic screen, abdominal U/S, HIDA scan, sweat chloride
- predicting occurrence of severe hyperbilirubinemia (Refer to: <http://www.cps.ca/documents/position/hyperbilirubinemia-newborn>)
 - either TSB or TcB concentration be measured in all infants between 24 h and 72 h of life
 - if the infant does not require immediate treatment, results should be plotted on predictive nomogram to determine the risk of progression to severe hyperbilirubinemia

TREATMENT OF UNCONJUGATED HYPERBILIRUBINEMIA

- to prevent kernicterus
- breastfeeding does not usually need to be discontinued, ensure adequate feeds and hydration
- lactation consultant support, mother to pump after feeds
- treat underlying causes (e.g. sepsis)
- phototherapy (blue-green wavelength, not UV light)
 - insoluble unconjugated bilirubin is converted to excretable form via photoisomerization
 - serum bilirubin should be monitored during and immediately after therapy (risk of rebound because photoisomerization reversible when phototherapy discontinued)
 - contraindicated in conjugated hyperbilirubinemia: results in “bronzed” baby
 - side effects: skin rash, diarrhea, eye damage (eye shield used routinely for prevention), dehydration
 - use published guidelines and nomogram for initiation of phototherapy
- exchange transfusion
 - indications: high bilirubin levels as per published graphs based on age, weeks gestation
 - most commonly performed for hemolytic disease and G6PD deficiency
 - use of IVIg in case of severe hyperbilirubinemia (DAT+) becoming evidence-based practice

KERNICTERUS**Etiology**

- unconjugated bilirubin concentrations exceed albumin binding capacity and bilirubin is deposited in the brain resulting in permanent damage (typically basal ganglia or brainstem)
- incidence increases as serum bilirubin levels increase above 340 $\mu\text{mol/L}$
- can occur at lower levels in presence of sepsis, meningitis, hemolysis, hypoxia, acidosis, hypothermia, hypoglycemia, and prematurity

Clinical Presentation

- up to 15% of infants have no obvious neurologic symptoms
- early stage: lethargy, hypotonia, poor feeding, emesis (bilirubin encephalopathy)
- mid stage: hypertonia, high pitched cry, opisthotonic posturing (back arching), bulging fontanelle, seizures, pulmonary hemorrhage
- late stage (first year and beyond)
 - hypotonia, delayed motor skills, extrapyramidal abnormalities (choreoathetoid CP), gaze palsy, mitral regurgitation, sensorineural hearing loss

Prevention

- exchange transfusion, IVIg if indicated

“Bronzed” Baby in Infants with Conjugated Hyperbilirubinemia
Phototherapy results in the production and accumulation of a toxic metabolite which also imparts a bronze hue on the baby’s skin

Figure 14. Gold standard in deciding when to initiate phototherapy for unconjugated hyperbilirubinemia

BILIARY ATRESIA

Definition

- atresia of the extrahepatic bile ducts which leads to cholestasis and increased conjugated bilirubin after the first wk of life
- progressive obliterative cholangiopathy

Epidemiology

- incidence: 1:10,000-15,000 live births
- associated anomalies in 10-35% of cases: situs inversus, congenital heart defects, polysplenia

Clinical Presentation

- dark urine, pale stool, jaundice (persisting for >2 wk), abdominal distension, hepatomegaly

Diagnosis

- conjugated hyperbilirubinemia, abdominal U/S, operative cholangiogram
- HIDA scan (may be bypassed in favour of biopsy if timing of diagnosis is critical)
- liver biopsy

Treatment

- surgical drainage procedure
- hepatoportoenterostomy (Kasai procedure; most successful if <8 wk of age)
- two-thirds will eventually require liver transplantation
- vitamins A, D, E, and K; diet should be enriched with medium-chain triglycerides to ensure adequate fat ingestion

Necrotizing Enterocolitis

Definition

- intestinal inflammation associated with focal or diffuse ulceration and necrosis
- primarily affecting terminal ileum and colon

Epidemiology

- affects 1-5% of preterm newborns admitted to NICU

Pathophysiology

- postulated mechanism of bowel ischemia: mucosal damage and enteral feeding → bacterial growth → bowel necrosis/gangrene/perforation

Risk Factors

- prematurity (immature defenses)
- asphyxia, shock (poor bowel perfusion)
- hyperosmolar feeds
- enteral feeding with formula (breast milk can be protective)
- sepsis

Clinical Presentation

- usually presents at 2-3 wk of age
- distended abdomen
- increased amount of gastric aspirate/vomit with bile staining
- frank or occult blood in stool
- feeding intolerance
- diminished bowel sounds
- signs of bowel perforation (sepsis, shock, peritonitis, DIC)

Investigations

- AXR: pneumatosis intestinalis (intramural air is a hallmark of NEC), free air, fixed loops, ileus, thickened bowel wall, portal venous gas
- CBC, ABG, lactate, blood culture, electrolytes
- high or low WBC, low platelets, hyponatremia, acidosis, hypoxia, hypercapnea

Treatment

- NPO (7-10 d), vigorous IV fluid resuscitation, decompression with NG tube, supportive therapy
- TPN
- antibiotics (usually ampicillin, gentamicin ± metronidazole if risk of perforation x 7-10 d)
- serial AXRs detect early perforation (40% mortality in perforated NEC)
- peritoneal drain/surgery if perforation
- surgical resection of necrotic bowel and surgery for complications (e.g. perforation, strictures)

Influence of Enteral Nutrition on Occurrences of Necrotizing Enterocolitis in Very-Low-Birth-Weight Infants

J Pediatr Gastroenterol Nutr 2015;61(4):445-50
Study: Case-control study of very-low-birth-weight (VLBW) infants and occurrences of NEC within 30 d of life.

Population: 1028 VLBW infants in neonatal intensive care unit Jan 2003-May 2008.

Main Outcome: NEC defined using stage ≥2 of modified Bell criteria.

Results: 55 infants developed NEC within 30 d of life (5.4%). Those with NEC had higher odds of having been fed breast milk <7 d (OR: 4.02), not having achieved full enteral feeding during the first mo (OR: 3.50), and having had parenteral feeding (OR: 2.70).

Conclusions: Occurrence of NEC can be reduced with breast milk feeding beyond 7 d and early full enteral feeding.

Persistent Pulmonary Hypertension of the Newborn

Definition

- persistence of fetal circulation as a result of persistent elevation of pulmonary vascular resistance
- classified as primary (absence of risk factors) or secondary

Epidemiology

- incidence 1.9/1,000 live births

Clinical Presentation

- usually presents within 12 h of birth with severe hypoxemia/cyanosis; may have only mild respiratory distress

Pathophysiology

- elevated pulmonary pressures cause R → L shunt through PDA, foramen ovale → decreased pulmonary blood flow and hypoxemia → further pulmonary vasoconstriction

Risk Factors

- secondary PPHN: asphyxia, MAS, RDS, sepsis, pneumonia, structural abnormalities (e.g. diaphragmatic hernia, pulmonary hypoplasia)
- more common in term or post-term infants

Investigations

- measure pre- and post-ductal oxygen levels
- hyperoxia test to exclude CHD
- ECG (RV strain)
- Echo reveals increased pulmonary arterial pressure and a R → L shunt across PDA and patent foramen ovale; also used to rule out other cardiac defects

Treatment

- maintain good oxygenation (SaO₂ >95%) in at-risk infants
- O₂ given early and tapered slowly, minimize stress and metabolic demands, maintain normal blood gases, circulatory support
- mechanical ventilation, high frequency oscillation in a sedated muscle-relaxed infant
- nitric oxide, surfactant
- extracorporeal membrane oxygenation used in some centres when other therapy fails

Respiratory Distress in the Newborn

Clinical Presentation

- tachypnea: RR >60/min; tachycardia: HR >160/min
- grunting, subcostal/intercostal indrawing, nasal flaring
- duskiness, central cyanosis
- decreased air entry, crackles on auscultation

Differential Diagnosis of Respiratory Distress

- pulmonary: RDS (Respiratory Distress Syndrome), TTN (Transient Tachypnea of the Newborn), MAS (Meconium Aspiration Syndrome), pleural effusion, pneumothorax, congenital lung malformations
- infectious: sepsis, pneumonia
- cardiac: CHD (cyanotic, acyanotic), PPHN
- hematologic: blood loss, polycythemia
- anatomic: TEF, congenital diaphragmatic hernia, mucous or meconium plug, upper airway obstruction (see [Otolaryngology, OT41](#))
- metabolic: hypoglycemia, inborn errors of metabolism
- neurologic: CNS damage (trauma, hemorrhage), drug withdrawal syndromes

Investigations

- CXR, ABG (or venous blood gas from umbilical venous line)
- CBC, blood cultures, blood glucose
- ECG if indicated

Table 28. Distinguishing Features of RDS, TTN, MAS

	RDS	TTN	MAS
Etiology	Surfactant deficiency → poor lung compliance due to high alveolar surface tension → atelectasis → ↓ surface area for gas exchange → hypoxia + acidosis → respiratory distress “Hyaline membrane disease”	Delayed resorption of fetal lung fluid → accumulation of fluid in peribronchial lymphatics and vascular spaces → tachypnea “Wet lung syndrome”	Meconium is sterile but causes airway obstruction, chemical inflammation, and surfactant inactivation leading to chemical pneumonitis
Gestational Age	Preterm	Usually term and late preterm	Term and post-term
Risk Factors	Maternal DM Preterm delivery Male sex LBW Acidosis, sepsis Hypothermia Second born twin	Maternal DM Maternal asthma Male sex Macrosomia (>4,500 g) Elective Cesarean section or short labour Late preterm delivery	Meconium-stained amniotic fluid Post-term delivery
Clinical Presentation	Respiratory distress within first few hours of life, worsens over next 24-72 h Hypoxia Cyanosis	Tachypnea within the first few hours of life ± retractions, grunting, nasal flaring Often NO hypoxia or cyanosis	Respiratory distress within hours of birth Small airway obstruction, chemical pneumonitis tachypnea, barrel chest with audible crackles Hypoxia
CXR Findings	Homogenous infiltrates Air bronchograms Decreased lung volumes May resemble pneumonia (GBS) If severe, “white-out” with no differentiation of cardiac border	Perihilar infiltrates “Wet silhouette”; fluid in fissures	Hyperinflation Patchy atelectasis Patchy and coarse infiltrates 10-20% have pneumothorax
Prevention	Prenatal corticosteroids (e.g. Celestone® 12 mg q24h x 2 doses) if risk of preterm delivery <34 wk Monitor lecithin:sphingomyelin (L/S) ratio with amniocentesis, L/S >2:1 indicates lung maturity	Where possible, avoidance of elective Cesarean delivery, particularly before 38 wk GA	If infant is depressed at birth, intubate and suction below vocal cords Avoidance of factors associated with <i>in utero</i> passage of meconium (e.g. post term delivery)
Treatment	Resuscitation Oxygen Ventilation Surfactant (decreases alveolar surface tension, improves lung compliance, and maintains functional residual capacity)	Supportive Oxygen if hypoxic Ventilator support (e.g. CPAP) IV fluids and NG tube feeds if too tachypneic to feed orally	Resuscitation Oxygen Ventilatory support Surfactant Inhaled nitric oxide Extracorporeal membrane oxygenation for PPHN
Complications	In severe prematurity and/or prolonged ventilation, increased risk of bronchopulmonary dysplasia	Hypoxemia Hypercapnea Acidosis PPHN	Hypoxemia Hypercapnea Acidosis PPHN Pneumothorax Pneumomediastinum Chemical pneumonitis Secondary surfactant inhibition Respiratory failure
Prognosis	Dependent on GA at birth and severity of underlying lung disease; long-term risks of chronic lung disease	Recovery usually expected in 24-72 h	Dependent on severity, mortality up to 20%

PNEUMONIA

- see [Respirology, P75](#)
- consider in infants with prolonged or premature rupture of membranes, maternal fever, or if mother is GBS positive
- suspect if infant exhibits respiratory distress, temperature instability, or WBC is low, elevated, or left-shifted
- symptoms may be non-specific
- CXR: hazy lung and/or distinct infiltrates (may be difficult to differentiate from RDS)

Retinopathy of Prematurity

- see [Ophthalmology, OP38](#)

Sepsis in the Neonate

Table 29. Sepsis Considerations in the Neonate

Early Onset (<72 h)	Late Onset (72 h – 28 d)
Vertical transmission, 95% present within 24 h after birth Risk factors: Maternal infection: UTI, GBS positive, previous child with GBS sepsis or meningitis Maternal fever/leukocytosis/chorioamnionitis Prolonged rupture of membranes (>18 h) Preterm labour Pathogens: GBS, <i>E. coli</i> , <i>Listeria</i> most common Pneumonia more common with early onset sepsis	Acquired after birth Most common in preterm infants in NICU (most commonly due to coagulase negative <i>Staphylococcus</i>) Other pathogens implicated include GBS, anaerobes, <i>E. coli</i> , <i>Klebsiella</i>

Signs of Sepsis

- no reliable absolute indicator of occult bacteremia in infants <3 mo, most specific result has been WBC <5
- temperature instability (hypo/hyperthermia)
- respiratory distress, cyanosis, apnea
- tachycardia/bradycardia
- lethargy, irritability
- poor feeding, vomiting, abdominal distension, diarrhea
- hypotonia, seizures, lethargy
- jaundice, hepatomegaly, petechiae, purpura

Skin Conditions of the Neonate

Table 30. Common Neonatal Skin Conditions

Neonatal Skin Condition	Description
Vasomotor Response (Cutis Marmorata, Acrocyanosis)	Transient mottling when exposed to cold; usually normal, particularly if premature
Vernix Caseosa	Soft, creamy, white layer covering baby at birth
Congenital Dermal Melanocytosis (‘Mongolian Spots’)	Slate grey macules over lower back and buttocks (may look like bruises); common in dark skinned infants
Capillary Hemangioma	Raised red lesion, which increases in size after birth and involutes; 50% resolved by 5 yr, 90% by 9 yr
Erythema Toxicum	Yellow-white papules/pustules surrounded by erythema, eosinophils within the lesions; common rash, resolves by 2 wk
Milia	Lesions 1-2 mm firm white pearly papules on nasal bridge, cheeks, and palate; self-resolving
Transient Pustular Melanosis	Brown macular base with pustules, seen more commonly in African American infants; may be present at birth
Nevus Simplex (Salmon Patch)	Transient macular vascular malformation of the eyelids and/or neck (“Angel Kiss” or “Stork Bite”); most lesions disappear by 1 yr of life
Neonatal Acne	Inflammatory papules and pustules mainly on face; self-resolving usually within 4 mo

Fluids and Electrolytes

Approach to Infant/Child with Dehydration

Etiology

- decreased intake: poor oral intake during acute illness, breastfeeding difficulties, eating disorders
- increased losses: common sites include GI tract (diarrhea, vomiting, bleeding), skin/mucous membranes (fever, burns, hemorrhage, stomatitis), urine (osmotic diuresis [e.g. hyperglycemia, DKA], diuretic therapy, DI, post-obstructive/post ATN recovery diuresis), and respiratory tract (tachypnea, bronchiolitis, pneumonia)

Chronic Perinatal Infections

CHEAP TORCHES

- Chicken pox/shingles
- Hepatitis B
- Epstein-Barr virus
- AIDS (HIV)
- Parvovirus B19 (erythema infectiosum)
- Toxoplasmosis
- Other
- Rubella virus
- Cytomegalovirus/Coxsackievirus
- HSV
- Every STI
- Syphilis

See [Obstetrics, OB29](#)

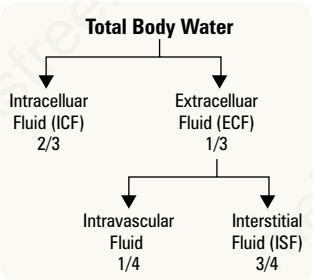

Figure 15. Body fluid compartments

Management

- if suspect dehydration based on history (acute illness, decreased number of wet diapers, lethargy, changes in mental status, increased thirst, etc.), you must:

1) Determine degree of extracellular volume contraction

Table 31. Assessment of Degree of Extracellular Volume Contraction Based on Physical Exam

	Mild	Moderate	Severe
<2 yr	5%*	10%*	15%*
>2 yr	3%*	6%*	9%*
Pulse	Normal, full	Rapid	Rapid, weak
Blood Pressure	Normal	Low to normal	Decreased in shock (very late finding in pediatrics and very dangerous)
Urine Output	Decreased	Markedly decreased	Anuria
Oral Mucosa	Slightly dry	Dry	Parched
Anterior Fontanelle	Normal	Sunken	Markedly sunken
Eyes	Normal	Sunken	Markedly sunken
Skin Turgor	Normal	Decreased	Tenting
Capillary Refill	Normal (<3 s)	Normal to increased	Increased (>3 s)

* Note that percentages refer to percent loss of pre-illness body weight

Assessment of Severity of Dehydration

- C BASE H₂O**
- Capillary refill
- BP
- Anterior fontanelle
- Skin turgor
- Eyes sunken
- HR
- Oral mucosa
- Output of urine

2) Determine the likely electrolyte disturbance

- dependent on etiology of dehydration and type of fluid loss (isotonic vs. hypertonic vs. hypotonic)

Table 32. Electrolyte Content of Various Bodily Fluids

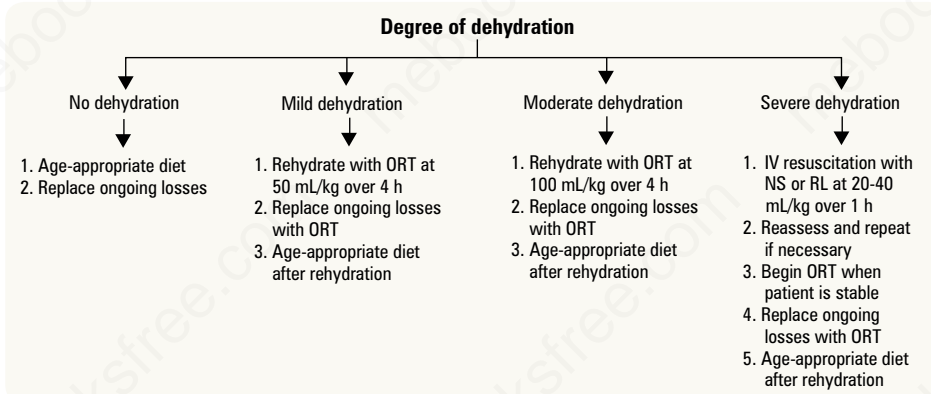

Bodily Fluid	Na ⁺ (mmol/L)	K ⁺ (mmol/L)	Cl ⁻ (mmol/L)	HCO ₃ ⁻ (mmol/L)
Saliva	30-80	20	70	30
Gastric Juice	60-80	15	100	0
Pancreatic Juice	140	5-10	60-90	40-100
Bile	140	5-10	100	40
Small Bowel	140	20	100	25-50
Large Bowel	75	30	30	0
Sweat	20-70	5-10	40-60	0

- for moderate and severe dehydration, initial investigations should include urinalysis and blood work examining electrolyte (Na⁺, K⁺, Cl⁻), glucose, and acid-base (blood pH, pCO₂, HCO₃⁻ disturbances), and impaired renal function (creatinine, BUN)

3) Determine if the child requires PO or IV rehydration

- dehydrated child must receive adequate fluid management, including replacement of ongoing losses and maintenance fluids
- ORT indication: mild to moderate dehydration caused by diarrhea
 - advantages: ↓ cost, no IV needed, no increase in incidence of iatrogenic hyper/hyponatremia, parental involvement in therapy
- IV rehydration indications: indications for IV rehydration therapy: severe dehydration requiring close monitoring and frequent assessment of electrolytes, inability to tolerate ORT (e.g. vomiting, alteration in mental status, ileus, monosaccharide malabsorption, etc.), inability to provide ORT, failure of ORT in providing adequate rehydration (e.g. persistent diarrhea or vomiting)

4) Return the child to a normal volume and electrolyte status by replacing current deficits and ongoing losses

Special Consideration – SIADH

Clinical Signs: hyponatremia and excretion of concentrated urine

Risk Factors: certain medications (e.g. morphine), post-operative, pain, N/V, pulmonary disease (e.g. pneumonia), CNS disease (e.g. meningitis)

Caution: acute hyponatremia is associated with rapid administration of hypotonic IV fluids, this can lead to cerebral edema and brain herniation or central pontine myelinolysis

Figure 16. Algorithm for deficit replacement and replacement of ongoing losses in the dehydrated child

5) Provide the appropriate fluid and electrolyte maintenance daily requirements

Table 33. Maintenance Fluid Requirements

Body Weight	100:50:20 Rule (24 h maintenance fluids)	4:2:1 Rule (hourly rate of maintenance fluids)
1-10 kg	100 cc/kg/d	4 cc/kg/h
11-20 kg	1000 cc + 50 cc/kg/d for every kg > 10 kg	40 cc + 2 cc/kg/h for every kg > 10 kg
>20 kg	1500 cc + 20 cc/kg/d for every kg > 20 kg	60 cc + 1 cc/kg/h for every kg > 20 kg

- in children, all maintenance fluids should have a dextrose component due to their higher risk of hypoglycemia, especially if they are NPO
- common IV fluid combinations used in pediatrics
 - newborn: D10W
 - first month of life: D5W/0.45 2 NS + KCl 20 mEq/L (only add KCl if voiding well)
 - children: D5W/NS + KCl 20 mEq/L or D5W/0.45 NS + KCl 20 mEq/L; NS bolus for dehydration
- most important thing to remember when correcting Na aberrations due to fluid deficits
 - risk of cerebral edema with rapid rehydration with hypotonic or isotonic solutions (i.e. NS), therefore replace fluid slowly with close monitoring; aim to adjust (increase or decrease) plasma $[Na^+]$ by no more than 12 mmol/L/d
 - management depends on etiology, severity of symptoms, and timing (acute vs. chronic)

6) Continue to monitor fluid and electrolyte status

- accurate monitoring of daily fluid intake (PO and IV) and ongoing losses (urine output, diarrhea, emesis, drains)
- if child receiving >50% of maintenance fluids through IV, serum electrolyte values should be monitored daily and therapy adjusted accordingly
- avoid iatrogenic hyper/hyponatremia, keep the possibility of SIADH in mind

Nephrology

Common Pediatric Renal Diseases

Table 34. Common Manifestations of Renal Disease

Neonate	Common Causes
Flank Mass	Hydronephrosis, polycystic disease (autosomal dominant or recessive subtypes), tumour
Hematuria	Renal vein thrombosis, asphyxia, malformation, trauma
Anuria/Oliguria	Bilateral renal agenesis, obstruction, asphyxia
Child and Adolescent	
Cola/Red-Coloured Urine	Acute GN (post-streptococcal, HSP, IgA nephropathy, etc.), hemoglobinuria (hemolysis), myoglobinuria (rhabdomyolysis)
Gross Hematuria	Urologic disease (nephrolithiasis, trauma, etc.), UTI, acute GN
Edema	Nephrotic syndrome, nephritis, acute/chronic renal failure, consider cardiac or liver disease
HTN	GN, renal failure, dysplasia (consider coarctation, drugs, endocrine causes)
Polyuria	DM, central and nephrogenic DI, renal Fanconi's syndrome (genetic/metabolic/acquired causes), hypercalcemia, polyuric renal failure (renal dysplasia)
Proteinuria	Orthostatic, nephrotic syndrome (MCD, etc.), GN
Oliguria	Dehydration, ATN, interstitial nephritis, acute or chronic kidney disease (i.e. renal failure)
Urgency	UTI, vulvovaginitis

Hemolytic Uremic Syndrome

Definition

- simultaneous occurrence of the triad of 1) non-immune microangiopathic hemolytic anemia, 2) thrombocytopenia, and 3) acute renal injury

Epidemiology

- annual incidence of 1-2 per 100,000 in Canada
- most common cause of acute renal failure in children

Etiology

- diarrhea positive HUS: 90% of pediatric HUS from *E. coli* O157:H7, shiga toxin, or verotoxin
- diarrhea negative HUS: other bacteria, viruses, drugs, familial/genetic

Pathophysiology

- toxin binds, invades, and destroys colonic epithelial cells, causing bloody diarrhea
- toxin enters the systemic circulation, attaches to, and injures endothelial cells (especially in kidney), causing a release of endothelial products (e.g. von Willebrand factor, platelet aggregating factor)
- platelet/fibrin thrombi form in multiple organ systems (e.g. kidney, pancreas, brain, etc.) resulting in thrombocytopenia
- RBCs are forced through occluded vessels, resulting in fragmented RBCs (schistocytes) that are removed by the reticuloendothelial system (hemolytic anemia)

History and Physical Exam

- history: initial presentation of abdominal pain and diarrhea, followed by bloody diarrhea; within 5-7 d begins to show signs of anemia, thrombocytopenia, and renal insufficiency
- physical exam: pallor, jaundice (hemolysis), edema, petechiae, HTN

Investigations

- CBC (anemia, thrombocytopenia), blood smear (schistocytes), electrolytes, renal function, urinalysis (microscopic hematuria), stool cultures, and verotoxin/shigella toxin assay

Management

- mainly supportive: nutrition, hydration, ventilation (if necessary), blood transfusion for symptomatic anemia
- monitor electrolytes and renal function: dialysis if electrolyte abnormality (hyperkalemia) cannot be corrected, fluid overload, or uremia
- steroids are not helpful
- antibiotics are contraindicated because death of bacteria leads to increased toxin release and worse clinical course

Prognosis

- <5% mortality, 5-25% long-term renal damage (HTN, proteinuria, decreased renal function)

Nephritic Syndrome

Definition

- acute or chronic syndrome affecting the kidney, characterized by glomerular injury and inflammation, and defined by hematuria (>5 RBCs per high-powered microscope field) and the presence of dysmorphic RBCs and RBC casts on urinalysis
- often accompanied by at least one of proteinuria (<50 mg/kg/d), edema, HTN, azotemia, and oliguria

Epidemiology

- highest incidence in children aged 5-15 yr old

Etiology

- humoral immune response to a variety of etiologic agents → immunoglobulin deposition → complement activation, leukocyte recruitment, release of growth factors/cytokines → glomerular inflammation and injury → porous podocytes → hematuria + RBC casts ± proteinuria
- HTN secondary to fluid retention and increased renin secretion by ischemic kidneys

Table 35. Major Causes of Nephritic Syndrome

	Decreased C3	Normal C3
Primary (idiopathic)	Post-infectious GN (most common cause of acute GN in pediatrics) Membranoproliferative Type I (50-80%) Type II (>80%)	IgA nephropathy Idiopathic rapidly progressive GN Anti-GBM disease
Secondary (systemic disease)	SLE Bacterial endocarditis Abscess or shunt nephritis Cryoglobulinemia	HSP (very common) Polyarteritis nodosa Granulomatosis with polyangiitis Goodpasture's syndrome

History and Physical Exam

- often asymptomatic; some overlap in clinical findings for nephritic and nephrotic syndrome
- gross hematuria, mild-moderate edema, oliguria, HTN
- signs and symptoms suggestive of underlying systemic causes (e.g. fever, arthralgias, rash, dyspnea, pulmonary hemorrhage)

Investigations

- urine
 - dipstick (hematuria, 0 to 2+ proteinuria) and microscopy (>5 RBCs per high-powered microscope field, acanthocytes, RBC casts)
 - first morning urine protein/creatinine ratio (<200 mg/mmol)

Nephritic Syndrome

PHAROH
 Proteinuria (<50 mg/kg/d)
 Hematuria
 Azotemia
 RBC casts
 Oliguria
 HTN

- blood work
 - impaired renal function (\uparrow Cr and BUN) resulting in \downarrow pH and electrolyte abnormalities (hyperkalemia, hyperphosphatemia, hypocalcemia)
 - mild anemia on CBC (secondary to hematuria)
 - hypoalbuminemia (secondary to proteinuria)
 - appropriate investigations to determine etiology: C3/C4 levels, serologic testing for recent streptococcal infection (ASOT, anti-hyaluronidase, anti-streptokinase, anti-NAD, anti-DNAse B), ANA, anti-DNA antibodies, ANCA, serum IgA levels, anti-GBM antibodies
- renal biopsy should be considered only in the presence of acute renal failure, no evidence of streptococcal infection, normal C3/C4

Management

- treat underlying cause
- symptomatic
 - renal insufficiency: supportive (dialysis if necessary), proper hydration
 - HTN: salt and fluid restriction (but not at expense of renal function), ACEI or ARBs for chronic persistent HTN (not acute cases because ACEI or ARBs may decrease GFR further)
 - edema: salt and fluid restriction, possibly diuretics (avoid if significant intravascular depletion)
- corticosteroids if indicated: IgA nephropathy, lupus nephritis, etc.

Prognosis

- dependent on underlying etiology
- complications include HTN, heart failure, pulmonary edema, chronic kidney injury (requiring renal transplant)

Nephrotic Syndrome

Definition

- clinical syndrome affecting the kidney, characterized by significant proteinuria, peripheral edema, hypoalbuminemia, and hyperlipidemia

Epidemiology

- highest incidence in children 2-6 yr old, M>F

Etiology

- primary (idiopathic): nephrotic syndrome in the absence of systemic disease (most common cause in pediatrics)
 - glomerular inflammation ABSENT on renal biopsy: MCD (85%), focal segmental glomerular sclerosis
 - glomerular inflammation PRESENT on renal biopsy: membranoproliferative GN, IgA nephropathy
- secondary: nephrotic syndrome associated with systemic disease or due to another process causing glomerular injury (<10% in pediatrics)
 - autoimmune: SLE, DM, rheumatoid arthritis
 - genetic: sickle cell disease, Alport syndrome
 - infections: hepatitis B/C, post-streptococcal, infective endocarditis, HUS, HIV
 - malignancies: leukemia, lymphoma
 - medications: captopril, penicillamine, NSAIDs, antiepileptics
 - vasculitides: HSP, granulomatosis with polyangiitis
- congenital: congenital nephropathy of the Finnish type, Denys-Drash syndrome, etc.

History and Physical Exam

- non-specific symptoms such as irritability, malaise, fatigue, anorexia, or diarrhea
- edema
 - often first sign; detectable when fluid retention exceeds 3-5% of body weight
 - starts periorbital and often pretibial \rightarrow edematous areas are white, soft, and pitting
 - gravity dependent: periorbital edema \downarrow and pretibial edema \uparrow over the day
 - anasarca may develop (i.e. marked periorbital and peripheral edema, ascites, pleural effusions, scrotal/labial edema)
- decrease in effective circulating volume (e.g. tachycardia, HTN, oliguria, etc.)
- foamy urine is a possible sign of proteinuria

PALE

Proteinuria (>50 mg/kg/d)
HypoAlbuminemia (<20 g/L)
HyperLipidemia
Edema

Daily protein excretion can be estimated from a random urine protein/creatinine ratio

Investigations

- urine
 - urine dipstick (3 to 4+ proteinuria, microscopic hematuria) and microscopy (oval fat bodies, hyaline casts)
 - first morning urine protein/creatinine ratio (>200 mg/mmol)
- blood work
 - diagnostic: hypoalbuminemia (<25 g/L), hyperlipidemia/hypercholesterolemia (total cholesterol >5 mmol/L)
 - secondary: electrolytes (hypocalcemia, hyperkalemia, hyponatremia), renal function (↑ BUN and Cr), coagulation profile (↓ PTT)
 - appropriate investigations to rule out secondary causes: CBC, blood smear, C3/C4, ANA, hepatitis B/C titres, ASOT, HIV serology, etc.
- consider renal biopsy if: HTN, gross hematuria, renal function, low serum C3/C4, no response to steroids after 4 wk of therapy, frequent relapses (>2 in 6 mo), presentation before first yr of life (high likelihood of congenital nephrotic syndrome), presentation ≥12 yr (rule out more serious renal pathology than MCD)

Management

- MCD: oral prednisone 2 mg/kg/d (or equivalent) for up to 12 wk → varicella status should be known before starting
- consider cytotoxic agents, immunomodulators, or high-dose pulse corticosteroid if steroid resistant
- symptomatic
 - edema: salt and fluid restriction, possibly diuretic (avoid if significant intravascular depletion); furosemide + albumin for anasarca
 - hyperlipidemia: generally resolves with remission; limit dietary fat intake; consider statin therapy if persistently nephrotic
 - hypoalbuminemia: IV albumin and furosemide not routinely given; consider if refractory edema
 - abnormal BP: control BP; fluid resuscitation if severe intravascular depletion; ACEI or ARBs for persistent HTN
- diet: no added salt; monitor caloric intake and supplement with Ca²⁺ and Vit D if on corticosteroids
- daily weights and BP to assess therapeutic progress
- secondary infections: treat with appropriate antimicrobials; antibiotic prophylaxis not recommended; pneumococcal vaccine at diagnosis and varicella vaccine after remission; varicella Ig + acyclovir if exposed while on corticosteroids
- secondary hypercoagulability: mobilize, avoid hemoconcentration due to hypovolemia, prompt sepsis treatment; heparin if thrombi occur

Prognosis

- generally good: 80% of children responsive to corticosteroids
- up to 2/3 experience relapse, often multiple times; sustained remission with normal kidney function usually by adolescence
- complications: ↑ risk of infections (spontaneous peritonitis, cellulitis, sepsis); hypercoagulability due to decreased intravascular volume and antithrombin III depletion (PE, renal vein thrombosis); intravascular volume depletion, leading to hypotension, shock, renal failure; side effects of drugs

Side Effects of Long-Term Steroid Use

- Increased appetite
- Weight gain
- Dorsal hump
- Impaired growth
- Behavioural changes
- Risk of infection
- Salt and water retention
- HTN
- Bone demineralization
- Skin striae

Hypertension in Childhood

Definition

- HTN: sBP and/or dBP ≥95th percentile for sex, age, and height on ≥3 occasions
- pre-HTN: sBP and/or dBP ≥90th percentile but <95th percentile OR BP ≥120/80 irrespective of age, gender, and height

Table 36. 95th Percentile Blood Pressures (mmHg)

Age (Yr)	Female		Male	
	50th Percentile for Height	75th Percentile for Height	50th Percentile for Height	75th Percentile for Height
1	104/58	105/59	103/56	104/57
6	111/74	113/74	114/74	115/75
12	123/80	124/81	123/81	125/82
17	129/84	130/85	136/87	138/87

Adapted from: the Fourth report on the diagnosis, evaluation, and treatment of high blood pressure in children and adolescents. National Heart, Lung and Blood Institute. National Institutes of Health. May 2004.

Epidemiology

- prevalence: 3-5% for HTN, 7-10% for pre-HTN; M>F
- increasing prevalence of pre-HTN over the last 25+ yr

Etiology

- primary HTN
 - diagnosis of exclusion
 - most common in older children (≥ 10 yr), especially if positive family history, overweight, and only mild HTN
 - responsible for ~90% of cases of HTN in adolescents, rarely in young children
- secondary HTN
 - identifiable cause of HTN (most likely etiology depends on age)
 - responsible for majority of childhood HTN
- always consider white coat HTN for all ages

Table 37. Etiology of Secondary HTN by Age Group

System	Neonates	1 mo-6 yr	7-12 yr	> 13 yr
Endocrine/ Metabolic	CAH	Wilms' tumour (\uparrow renin) Neuroblastoma (\uparrow catecholamines)	Endocrinopathies*	Endocrinopathies*
Renal	Congenital renal disease	Renal parenchymal disease	Renal parenchymal disease	Renal parenchymal disease
Vascular	Coarctation of the aorta Renal artery thrombosis	Coarctation of the aorta RAS	Renovascular abnormalities	
Drugs		Corticosteroids Cyclosporine and tacrolimus	Corticosteroids OCP Cyclosporine and tacrolimus	Corticosteroids OCP Cyclosporine and tacrolimus Recreational drugs (amphetamines, cocaine, etc.)

*Note: may include hyperthyroidism, hyperparathyroidism, Cushing's syndrome, primary hyperaldosteronism/Conn's syndrome, pheochromocytoma

Risk Factors

- primary HTN: male gender, positive family history, obesity, obstructive sleep apnea, African American, prematurity/LBW
- secondary HTN: history of renal disease, abdominal trauma, family history of autoimmune diseases, umbilical artery catheterization

History

- often asymptomatic, but can include FTT, fatigue, epistaxis
- symptoms of hypertensive emergency
 - neurologic: headache, seizures, focal complaints, change in mental status, visual disturbances
 - cardiovascular: symptoms of MI or heart failure (chest pain, palpitations, cough, SOB)
- symptoms of secondary HTN: guided by etiology; ask about medications and recreational drugs (current and past)

Physical Exam

- BP measurement (make sure correct cuff size is used), plot on growth chart, BMI
- look for signs of hypertensive emergency (e.g. full neurologic exam, ophthalmoscopy, precordial exam, peripheral pulses, perfusion status)
- look for signs of secondary HTN

Investigations

- laboratory
 - urine dipstick for hematuria and/or proteinuria (renal disease), urine catecholamines (pheochromocytoma, neuroblastoma)
 - blood work: renal function tests (electrolytes, Cr, BUN), consider renin and aldosterone levels (RAS, Conn's syndrome, Wilms' tumour)
 - other specific hormones if indicated on history and physical
- imaging: Echo (coarctation, heart function), abdominal U/S (RAS, abdominal mass), renal radionuclide imaging (renal scarring)

Management

- treat underlying cause
- non-pharmacologic: modify concurrent cardiovascular risk factors (weight reduction, exercise, salt restriction, smoking cessation)
- pharmacologic: gradual lowering of BP using thiazide diuretics; no antihypertensives have been formally studied in children; if hypertensive emergencies use hydralazine, labetalol, sodium nitroprusside
- management of end-organ damage (e.g. retinopathy, LVH)
- consider referral to specialist

Prognosis

- end-organ damage (similar to adults) including LVH, CHF, cerebrovascular insults, renal disease, retinopathy

Signs of Secondary HTN

- Edema (renal parenchymal disease)
- Abdominal or renal bruit (RAS)
- Differential 4 limb BP/diminished femoral pulses (coarctation)
- Abdominal mass (Wilms', neuroblastoma)
- Goitre/skin changes (hyperthyroidism)
- Ambiguous genitalia (CAH)

Pediatric BP Calculation

$$\text{sBP} = \text{age} \times 2 + 90$$

$$\text{dBP} = 2/3 \times \text{sBP}$$

Neurology

Seizure Disorders

- see [Neurology, N18](#)

Differential Diagnosis of Seizures in Children

- benign febrile seizure
- CNS: infection, tumour, HIE, trauma, hemorrhage
- metabolic: hypoglycemia, hypocalcemia, hyponatremia
- idiopathic epilepsy and epileptic syndromes
- others: neurocutaneous syndromes, AVM, drug ingestions/withdrawal
- seizure mimics

Investigations

- lab tests: CBC, electrolytes, calcium, magnesium, glucose
- toxicology screen if indicated
- EEG
- CT/MRI, if indicated (focal neurological deficit or has not returned to baseline several hours after seizure)
- consider LP if first-time non-febrile seizure (not indicated for determining recurrence risk of benign febrile seizures or to determine seizure type or epileptic syndrome)

Heart problems, such as long QT syndrome and hypertrophic cardiomyopathy, are often misdiagnosed as epilepsy. Include cardiac causes of syncope in your differential diagnosis, particularly when the episodes occur during physical activity

CHILDHOOD EPILEPSY SYNDROMES

Infantile Spasms

- brief, repeated symmetric contractions of neck, trunk, extremities (flexion and extension) lasting 10-30 s
- occur in clusters; often associated with developmental delay; onset 4-8 mo
- 20% unknown etiology (usually good response to treatment); 80% due to metabolic or developmental abnormalities, encephalopathies, or are associated with neurocutaneous syndromes (usually poor response to treatment)
- can develop into West syndrome (infantile spasms, psychomotor developmental arrest, and hypsarrhythmia) or Lennox-Gastaut (see below)
- typical EEG: hypsarrhythmia (high voltage slow waves, spikes and polyspikes, background disorganization)
- management: ACTH, vigabatrin, benzodiazepines

Seizure Mimics

- Benign paroxysmal vertigo
- Breath holding
- Hypoglycemia
- Narcolepsy
- Night terror
- Pseudoseizure
- Syncope
- TIA
- Tic

Lennox-Gastaut

- characterized by triad of 1) multiple seizure types, 2) diffuse cognitive dysfunction, and 3) slow generalized spike and slow wave EEG
- onset commonly 3-5 yr of age
- seen with underlying encephalopathy and brain malformations
- management: valproic acid, benzodiazepines, and ketogenic diet; however, response often poor

Juvenile Myoclonic Epilepsy (Janz Syndrome)

- myoclonus particularly in morning; frequently presents as generalized tonic-clonic seizures
- adolescent onset (12-16 yr of age); autosomal dominant with variable penetrance
- typical EEG: 3.5-6 Hz irregular spike and wave, increased with photic stimulation
- management: lifelong treatment (valproic acid); excellent prognosis

Childhood Absence Epilepsy

- multiple daily absence seizures lasting <30 s without post-ictal state that may resolve spontaneously or become generalized in adolescence
- peak age of onset 6-7 yr, F>M, strong genetic predisposition
- typical EEG: 3 Hz spike and wave
- management: valproic acid or ethosuximide

Benign Focal Epilepsy of Childhood with Rolandic/Centrotemporal Spikes

- focal motor seizures involving tongue, mouth, face, upper extremity usually occurring in sleep-wake transition states; remains conscious, but aphasic post-ictally
- onset peaks at 5-10 yr of age; 16% of all non-febrile seizures; remits spontaneously in adolescence without sequelae
- typical EEG: repetitive spikes in centrotemporal area with normal background
- management: frequent seizures controlled by carbamazepine, no medication if infrequent seizures

General Approach to Treatment

- education for patient and parents including education and precautions in daily life (e.g. buddy system, showers instead of baths)
- medication
 - initiate: treatment with drug appropriate to seizure type; often if >2 unprovoked afebrile seizures within 6-12 mo
 - optimize: start with one drug and increase dosage until seizures controlled
 - if no effect, switch over to another before adding a second antiepileptic drug
 - continue antiepileptic drug therapy until patient free of seizures for >2 yr, then wean over 4-6 mo
- ketogenic diet (high fat diet): used in patients who do not respond to polytherapy or who do not wish to take medication (valproic acid contraindicated in conjunction with ketogenic diet because may increase hepatotoxicity)
- legal obligation to report to Ministry of Transportation if patient wishes to drive

Generalized and Partial Seizures

- see [Neurology, N18](#)

Ketogenic Diet and other Dietary Treatments for Epilepsy

Cochrane DB Syst Rev 2012;3:CD001903
Study: Systematic review of all studies of ketogenic and related diets. Included the review of 4 RCTs, 6 prospective studies, and 5 retrospective studies.
Population: Adults and children with diagnosed epilepsy of any type.
Intervention: Ketogenic diet, control (placebo diet, any treatment with known antiepileptic properties).
Main Outcome Measure: Seizure control at 3, 6, 12 mo.
Results: Studies showed a response rate of at least 38-50% seizure reduction at 3 mo. This response was maintained for up to a year. A range of side effects were reported. The most frequent were gastrointestinal effects (30%).
Conclusion: The ketogenic diet is a valid option for people with medically intractable epilepsy.

Febrile Seizures

Epidemiology

- most common cause of seizure in children (3-5% of children)
- M>F; age 6 mo-6 yr

Clinical Presentation

- often with associated illness or fever and family history
- no evidence of CNS infection/inflammation before or after seizure; no history of non-febrile seizures

Table 38. Comparison of Typical and Atypical Febrile Seizures

Simple/Typical (70-80%)	Complex/Atypical (20-30%)
All of the following: Duration <15 min (95% <5 min) Generalized tonic-clonic No recurrence in 24 h period No neurological impairment or developmental delay before or after seizure	At least one of the following: Duration >15 min Focal onset or focal features during seizure Recurrent seizures (>1 in 24 h period) Previous neurological impairment or neurological deficit after seizure

Workup

- history: determine focus of fever, description of seizure, medications, trauma history, development, family history
- physical exam: LOC, signs of meningitis, neurological exam, head circumference, focus of infection
- septic workup including LP if suspecting meningitis (strongly consider if child <12 mo; consider if child is 12-18 mo; only if meningeal signs present if child >18 mo)
- if typical febrile seizure, investigations only for determining focus of fever
- EEG/CT/MRI brain not warranted unless atypical febrile seizure or abnormal neurologic findings

Management

- counsel and reassure patient and parents
 - febrile seizures do not cause brain damage
 - very small risk of developing epilepsy: 9% in child with multiple risk factors; 2% in child with typical febrile seizures compared to 1% in general population
 - 33% chance of recurrence (mostly within 1 yr of first seizure and in children <1 yr old)
- antipyretics and fluids for comfort (though neither prevent seizure)
- prophylaxis with antiepileptic drugs not recommended
- if high risk for recurrent or prolonged seizures, have rectal or sublingual lorazepam at home
- treat underlying cause of fever

Recurrent Headache

- see [Neurology, N44](#)

Differential Diagnosis

- primary headache: tension, migraine, cluster
- secondary headache: see [Neurology, N44](#)

General Assessment

- if unremarkable history and neurological and general physical exam is negative, most likely diagnosis is migraine or tension headache
- CT or MRI if history or physical reveals red flags
- inquire about level of disability, academic performance, after-school activities

Headache – Red Flags

- First and worst headache of their life
- Sudden onset
- Focal neurological deficits
- Constitutional symptoms
- Worse in morning
- Worse with bending over, coughing, straining
- Change in LOC
- Sudden mood changes
- Pain that wakes patient
- Fatigue
- Affecting school attendance

Hypotonia

- decreased resistance to passive movements – “floppy baby”

Differential Diagnosis

- central: chromosomal (DS, Prader-Willi, Fragile X syndrome), metabolic (hypoglycemia, kernicterus), perinatal problems (asphyxia, ICH), endocrine (hypothyroidism, hypopituitarism), systemic illness (TORCH infection, sepsis, dehydration), CNS malformations, dysmorphic syndromes
- peripheral: motor neuron (spinal muscular atrophy, polio), peripheral nerve (Charcot-Marie-Tooth syndrome) neuromuscular junction (myasthenia gravis), muscle fibre (mitochondrial myopathy, muscular dystrophy, myotonic dystrophy)

History and Physical Exam

- proper assessment of tone requires accurate determination of GA
- differentiate between UMN and LMN lesion: spontaneous posture (spontaneous movement, movement against gravity, frog-leg position); muscle weakness; joint mobility (hyperextensibility); muscle bulk; presence of fasciculations
- postural maneuvers
 - traction response: pull to sit, look for flexion of arms to counteract traction and head lag
 - axillary suspension: suspend infant by holding at axilla and lifting; hypotonic babies will slip through grasp because of low shoulder girdle tone
 - ventral suspension: infant is prone and supported under the abdomen by one hand; infant should be able to hold up extremities; inverted “U” posturing demonstrates hypotonia
- dysmorphic features, cognitive ability, reflexes, strength

Causes of hypotonia that respond to rapid treatment: hypokalemia, hypermagnesemia, acidemia, toxins, drugs, hypoglycemia, seizure, infection, intracranial bleeding, hydrocephalus

Investigations

- rule out systemic disorders (e.g. electrolytes, ABG, blood glucose, CK, and serum/urine investigations for multiple etiologies including mitochondrial causes)
- neuroimaging: MRI/MRA when indicated
- EMG, muscle biopsy/NCS
- chromosome analysis, genetic testing, metabolic testing, neuromuscular testing

Treatment

- depends on etiology: some treatments available for specific diagnosis
- counsel parents on prognosis and genetic implications
- refer patients for specialized care, refer for rehabilitation, OT, PT, assess feeding ability

Cerebral Palsy

Definition

- a symptom complex, not a disease
- non-progressive central motor impairment syndrome due to insult to or anomaly of the immature CNS
- incidence: 1.5-2.5/1,000 live births (industrialized nations)
- life expectancy is dependent on the degree of mobility and intellectual impairment, not on severity of CNS lesion

Etiology

- often obscure, no definite etiology identified in 1/3 of cases
- 10% related to intrapartum asphyxia; 10% due to postnatal insult (infections, asphyxia, prematurity with IVH and trauma)
- association with LBW babies

Clinical Presentation

- general signs: delay in motor milestones, developmental delay, learning disabilities, visual/hearing impairment, seizures, microcephaly, uncoordinated swallow (aspiration)

Table 39. Types of Cerebral Palsy

Type	% of Total	Characteristics	Area of Brain Involved
Spastic	70-80%	Truncal hypotonia in first yr Increased tone, increased reflexes, clonus Can affect one limb (monoplegia), one side of body (hemiplegia), both legs (diplegia), or both arms and legs (quadriplegia)	UMN of pyramidal tract Diplegia associated with periventricular leukomalacia in premature babies Quadriplegia associated with HIE (asphyxia), higher incidence of intellectual disability
Athetoid/ Dyskinetic	10-15%	Athetosis (involuntary writhing movements) ± chorea (involuntary jerky movements) Can involve face, tongue (results in dysarthria)	Basal ganglia (may be associated with kernicterus)
Ataxic	<5%	Poor coordination, poor balance (wide based gait) Can have intention tremor	Cerebellum
Mixed	10-15%	More than one of the above motor patterns	

Investigations

- may include metabolic screen, chromosome studies, serology, neuroimaging (MRI), EMG, EEG (if seizures), ophthalmology assessment, audiology assessment

Treatment

- maximize potential through multidisciplinary services such as primary care physician, OT, PT, SLP, school supports, etc.
- orthopedic management (e.g. dislocations, contractures, rhizotomy)
- management of symptoms: spasticity (baclofen, Botox®), constipation (stool softeners)

Neurocutaneous Syndromes

- characterized by tendency to form tumours of the CNS, PNS, viscera, and skin

NEUROFIBROMATOSIS TYPE I

- autosomal dominant but 50% are the result of new mutations
- also known as von Recklinghausen disease
- incidence 1:3,000, mutation in NF1 gene on 17q11.2 (codes for neurofibromin protein)
- learning disorders, abnormal speech development, and seizures are common
- diagnosis of NF-1 requires 2 or more of:
 - ≥ 6 café-au-lait spots (>5 mm if prepubertal, >1.5 cm if postpubertal)
 - ≥ 2 neurofibromas of any type or one plexiform neurofibroma
 - ≥ 2 Lisch nodules (hamartomas of the iris)
 - optic glioma
 - freckling in the axillary or inguinal region
 - a distinctive bony lesion (e.g. sphenoid dysplasia, cortical thinning of long bones)
 - a first degree relative with confirmed NF-1

NEUROFIBROMATOSIS TYPE II

- autosomal dominant
- incidence 1:33,000
- characterized by predisposition to form intracranial, spinal tumours
- diagnosed when bilateral vestibular schwannomas are found, or a first-degree relative with NF-2 and either unilateral vestibular schwannoma, or any two of the following: meningioma, glioma, schwannoma, neurofibroma, posterior subcapsular lenticular opacities.
- treatment consists of monitoring for tumour development and surgery

In neurocutaneous syndromes, the younger the child at presentation, the more likely they are to develop intellectual disability

Respirology

Approach to Dyspnea

- determine if patient is sick or not sick; ABCs
- history: onset, previous episodes, precipitating events, associated symptoms, past medical/family history of respiratory disease
- physical exam: vitals, SpO₂, evidence of cyanosis, respiratory, cardiovascular
- investigations: CBC and differential, electrolytes, BUN, Cr, NP swab, ABG, CXR, ECG (based on clinical findings)

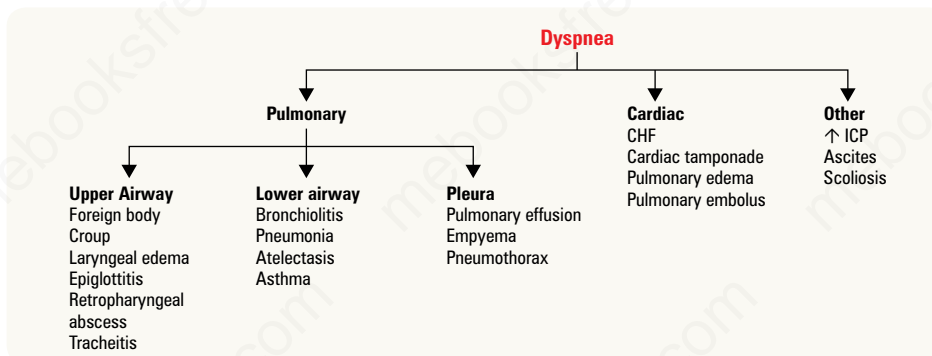

Figure 17. Approach to dyspnea in childhood

Upper Respiratory Tract Diseases

- see [Otolaryngology, OT40](#)
- diseases above the thoracic inlet characterized by inspiratory stridor, hoarseness, and suprasternal retractions
- differential diagnosis of stridor: croup, bacterial tracheitis, epiglottitis, foreign body aspiration, subglottic stenosis (congenital or iatrogenic), laryngomalacia/tracheomalacia (collapse of airway cartilage on inspiration)

Table 40. Common Upper Respiratory Tract Infections in Children

	Croup (Laryngotracheobronchitis)	Bacterial Tracheitis	Epiglottitis
Anatomy	Subglottic laryngitis	Subglottic tracheitis	Supraglottic laryngitis
Epidemiology	Common in children <6 yr, with peak incidence between 7-36 mo Common in fall and early winter	Rare All age groups	Very rare – due to Hib vaccination Usually older (2-6 yr)
Etiology	Parainfluenza (75%) Influenza A and B RSV Adenovirus	<i>S. aureus</i> <i>H. influenzae</i> α-hemolytic strep Pneumococcus <i>M. catarrhalis</i>	<i>H. influenzae</i> β-hemolytic strep
Clinical Presentation	Common prodrome: rhinorrhea, pharyngitis, cough ± low-grade fever Hoarse voice Barking cough Stridor Worse at night	Similar symptoms as croup, but more rapid deterioration with high fever Toxic appearance Does not respond to croup treatments	Toxic appearance Rapid progression 4 Ds – drooling, dysphagia, dysphonia, distress Stridor Tripod position Sternal recession Anxious Fever (>39°C)
Investigations	Clinical diagnosis CXR in atypical presentation: “steep sign” from subglottic narrowing	Clinical diagnosis Endoscopy: definitive diagnosis	Clinical diagnosis Avoid examining the throat to prevent further respiratory exacerbation
Treatment	Stridor at rest is an EMERGENCY No evidence for humidified O ₂ Dexamethasone: PO 1 dose Racemic epinephrine: nebulized, 1-3 doses, q1-2h Intubation if unresponsive to treatment	Usually requires intubation IV antibiotics	Intubation Antibiotics Prevented with Hib vaccine

Croup
Stridor at rest is an emergency

Lower Respiratory Tract Diseases

- obstruction of airways below thoracic inlet, produces more expiratory sounds
- classic symptom: wheezing

Differential Diagnosis of Wheezing

- common: asthma (recurrent wheezing episodes, identifiable triggers, typically over 6 yr), bronchiolitis (first episode of wheezing, usually under 1 yr), recurrent aspiration (often neurological impairment), pneumonia (fever, cough, malaise)
- uncommon: foreign body (acute unilateral wheezing and coughing), CF (prolonged wheezing, unresponsive to therapy), bronchopulmonary dysplasia (often develops after prolonged ventilation in the newborn)
- rare: CHF, mediastinal mass, bronchiolitis obliterans, tracheobronchial anomalies

Pneumonia

Etiology

- inflammation of pulmonary tissue, associated with consolidation of alveolar spaces

Clinical Presentation

- incidence is greatest in first year of life with viral causes being most common in children <5 yr
- fever, cough, tachypnea
- CXR: diffuse, streaky infiltrates bilaterally
- bacterial causes may present with cough, fever, chills, dyspnea, more dramatic CXR changes (e.g. lobar consolidation, pleural effusion)

Management

- supportive therapy: hydration, antipyretics, humidified O₂

Table 41. Common Causes and Treatment of Pneumonia at Different Ages

Age	Bacterial	Viral	Atypical Bacteria	Treatment
Neonates	GBS <i>E. coli</i> <i>Listeria</i>	CMV Herpes virus Enterovirus	<i>Mycoplasma hominis</i> <i>Ureaplasma urealyticum</i>	Ampicillin + gentamicin / tobramycin (add erythromycin if suspect <i>Chlamydia</i>)
1-3 mo	<i>S. aureus</i> <i>H. influenzae</i> <i>S. pneumoniae</i> <i>B. pertussis</i>	CMV, RSV Influenza Parainfluenza	<i>Chlamydia trachomatis</i> <i>Ureaplasma urealyticum</i>	Cefuroxime OR ampicillin ± erythromycin OR clarithromycin
3 mo-5 yr	<i>S. pneumoniae</i> <i>S. aureus</i> <i>H. influenzae</i> GAS	RSV Adenovirus Influenza	<i>Mycoplasma pneumoniae</i> TB	Amoxicillin (if mild) OR ampicillin OR cefuroxime
> 5 yr	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>S. aureus</i>	Influenza Varicella Adenovirus	<i>Mycoplasma pneumoniae</i> <i>Chlamydia pneumoniae</i> TB <i>Legionella pneumophila</i>	Erythromycin OR clarithromycin (1st line) OR ampicillin OR cefuroxime

Bronchiolitis

Definition

- LRTI, usually in children <2 yr, that has wheezing and signs of respiratory distress

Epidemiology

- the most common LRTI in infants, affects 50% of children in first 2 yr of life; peak incidence at 6 mo, winter or early spring
- increased incidence of asthma in later life

Etiology

- RSV (>50%), parainfluenza, influenza, rhinovirus, adenovirus, *M. pneumoniae* (rare)

Clinical Presentation

- prodrome of URTI with cough and/or rhinorrhea, possible fever
- feeding difficulties, irritability
- wheezing, crackles, respiratory distress, tachypnea, tachycardia, retractions, poor air entry; symptoms often peak at 3-4 d

Investigations

- CXR (only in severe disease, poor response to therapy, chronic episode): air trapping, peribronchial thickening, atelectasis, increased linear markings
- NP swab: direct detection of viral antigen (immunofluorescence)
- WBC can be normal

Treatment

- self-limiting disease with peak symptoms usually lasting 2-3 wk
- mild to moderate distress
 - supportive: PO or IV hydration, antipyretics for fever, regular or humidified high flow O₂
- severe distress
 - as above ± intubation and ventilation as needed
 - consider rebetol (Ribavirin®) in high risk groups: bronchopulmonary dysplasia, CHD, congenital lung disease, immunodeficient
- monthly RSV-Ig or palivizumab (monoclonal antibody against the F-glycoprotein of RSV) is protective against severe disease in high risk groups; case fatality rate <1%
- antibiotics have no therapeutic value unless there is secondary bacterial pneumonia
- indications for hospitalization
 - hypoxia: O₂ saturation <92% on initial presentation
 - persistent resting tachypnea >60/min and retractions after several salbutamol masks
 - past history of chronic lung disease, hemodynamically significant cardiac disease, neuromuscular problem, immunocompromised
 - young infants <6 mo old (unless extremely mild)
 - significant feeding problems
 - social problem (e.g. inadequate care at home)

Bronchodilators for Bronchiolitis

Cochrane DB Syst Rev 2010;12:CD001266

Purpose: To assess the effects of bronchodilators in infants with acute bronchiolitis.

Methods: Meta-analysis of placebo-controlled RCTs evaluating bronchodilators for bronchiolitis. Oxygen saturation was the main outcome.

Results: 30 trials with 1,992 infants with bronchiolitis were included. Oxygen saturation did not improve with bronchodilators (mean difference (MD) -0.43, 95% CI -0.92 to 0.06). Neither outpatient (11.9% vs. 15.9%, OR 0.75, 95% CI 1.21), nor inpatient (MD 0.06, 95% CI -0.27 to 0.39) reduced hospitalization rates. Effects on oximetry seen in inpatients (MD -0.62, 95% CI -1.40 to 0.16) were slightly larger than for outpatients (MD -0.25, 95% CI -0.61 to 0.11). No change in average clinical score was seen in inpatients (standardized MD -0.14, 95% CI -0.41 to 0.12), while a statistically significant decrease was seen in outpatients (SMD -0.42, 95% CI -0.79 to -0.06). Adverse events included tachycardia, oxygen desaturation and tremors.

Results: Bronchodilators do not improve oxygen saturation, rates of hospital admission, duration of hospitalizations, or durations to resolution of illness. They are not considered effective in routine management of bronchiolitis, especially given their adverse effects.

Children with bronchiolitis do not respond to ipratropium bromide (Atrovent®) or steroids

Asthma

Definition

- see [Respirology, R7](#)
- inflammatory disorder of the airways characterized by recurrent episodes of reversible small airway obstruction, resulting from airway hyperresponsiveness to endogenous and exogenous stimuli
- very common, presents most often in early childhood
- associated with other atopic diseases such as allergic rhinitis or atopic dermatitis

Clinical Presentation

- episodic bouts of wheezing, dyspnea, tachypnea, cough (usually at night/early morning, with activity, or cold exposure)
- physical exam may reveal hyper-resonant chest, prolonged expiration, wheeze

Triggers

- URTI (viral or *Mycoplasma*), weather (cold exposure, humidity changes), allergens (pets), irritants (cigarette smoke), exercise, emotional stress, drugs (ASA, β -blockers)

Classification

- mild: occasional attacks of wheezing or coughing (<2/wk); symptoms respond quickly to inhaled bronchodilator; never needs systemic corticosteroids
- moderate: more frequent episodes with symptoms persisting and chronic cough; decreased exercise tolerance; sometimes needs systemic corticosteroids
- severe: daily and nocturnal symptoms; frequent ED visits and hospitalizations; usually needs systemic corticosteroids

Management

- acute
 - O₂ (keep O₂ saturation >94%) and fluids if dehydrated
 - β 2-agonists: salbutamol (Ventolin*) MDI + spacer (nebulized or IV in very severe episodes with impending respiratory failure), 5 puffs (<20 kg) or 10 puffs q20min for first h (>20 kg)
 - ipratropium bromide (Atrovent*) if severe: MDI + spacer, 3 puffs (<20 kg) or 6 puffs (>20 kg) q20min with salbutamol, or add to first 3 salbutamol masks (0.25 mg if <20 kg, 0.5mg if >20 kg)
 - steroids: prednisone (1-2 mg/kg x 5 d) or dexamethasone (0.3 mg/kg/d x 5 d or 0.6 mg/kg/d x 2 d); in severe disease, use IV steroids
 - continue to observe; can discharge patient if asymptomatic for 2-4 h after last dose
- chronic
 - education, emotional support, avoid allergens or irritants, develop an "action plan"
 - exercise program (e.g. swimming)
 - monitor respiratory function with peak flow meter (improves self-awareness of status)
 - PFTs for children >6 yr
 - reliever therapy: short acting β 2-agonists (e.g. salbutamol)
 - controller therapy (first line therapy for all children): low dose daily inhaled corticosteroids
 - second line therapy for children <12 yr: moderate dose of daily inhaled corticosteroids
 - second line therapy for children >12 yr: leukotriene receptor antagonist OR long acting β 2-agonist in conjunction with low dose inhaled corticosteroids; leukotriene receptor antagonist monotherapy may be considered an alternative second line therapy
 - severe asthma unresponsive to first and second line treatments: injection immunotherapy
 - aerochamber for children using daily inhaled corticosteroids
- indications for hospitalization
 - ongoing need for supplemental O₂
 - persistently increased work of breathing
 - β 2-agonists are needed more often than q4h after 4-8 h of conventional treatment
 - patient deteriorates while on systemic steroids

Updated guidance for palivizumab prophylaxis among infants and young children at increased risk of hospitalization for respiratory syncytial virus infection

Pediatrics 2014 Aug;134(2):415-20

Erratum in: *Pediatrics* 2014 Dec;134(6):1221.

Palivizumab prophylaxis is recommended for the first year of life for infants born before 29 wk gestation, and preterm infants with chronic lung disease of maturity (born at <32 wk gestation and requiring >21% oxygen for at least 28 d after birth). Such prophylaxis may be administered in the first yr of life to infants with hemodynamically significant heart disease, and a maximum of 5 monthly 15 mg/kg doses may be administered during the RSV season to infants requiring it; infants born during the RSV season may need fewer doses. Prophylaxis may be considered in the first yr of life for children with pulmonary abnormalities or neuromuscular disease impairing the ability to clear secretions from the upper airway, and may be considered for children younger than 24 mo who are profoundly immunocompromised during the RSV season. Palivizumab prophylaxis is only recommended in the second year of life for children who required at least 28 d of supplemental oxygen after birth with ongoing medical intervention needs. Monthly prophylaxis should be discontinued in children experiencing breakthrough RSV hospitalizations. Insufficient evidence exists to support the use of prophylaxis for children with cystic fibrosis or Down's syndrome.

Canadian Pediatric Asthma Consensus Guidelines for Assessing Adequate Control of Asthma

CMAJ 2005;173(6 Suppl):S12-14

- Daytime symptoms < 4 d/wk
- Night time symptoms < 1 night/wk
- Normal physical activity
- Mild and infrequent exacerbations
- No work/school absenteeism
- Need for β -agonist < 4 doses/wk
- FEV1 or peak expiratory flow \geq 90% of personal best
- Peak expiratory flow diurnal variation < 10-15%

Cystic Fibrosis

- see [Respirology, R12](#)

Etiology

- 1 per 3,000 live births, mostly Caucasians
- autosomal recessive, *CFTR* gene found on chromosome 7 (Δ F508 mutation in 70%, but >1,600 different mutations identified) resulting in a dysfunctional chloride channel on the apical membrane of cells
- leads to relative dehydration of airway secretions, resulting in impaired mucociliary transport and airway obstruction

Clinical Presentation

- neonatal: meconium ileus, prolonged jaundice, antenatal bowel perforation
- infancy: pancreatic insufficiency with steatorrhea and FTT (despite voracious appetite), anemia, hypoproteinemia, hyponatremia
- childhood: heat intolerance, wheezing or chronic cough, recurrent chest infections (*S. aureus*, *P. aeruginosa*, *H. influenzae*), hemoptysis, nasal polyps, distal intestinal obstruction syndrome, rectal prolapse, clubbing of fingers
- older patients: COPD, infertility (males), decreased fertility (female)

Investigations

- sweat chloride test x 2 (>60 mEq/L)
 - false positive tests: malnutrition, atopic dermatitis, hypothyroidism, hypoparathyroidism, GSD, adrenal insufficiency, G6PD, Klinefelter syndrome, technical issues, autonomic dysfunction, familial cholestasis syndrome
 - false negative tests: technical problem with test, malnutrition, skin edema, mineralocorticoids

Management

- nutritional counselling: high calorie diet, pancreatic enzyme replacements, fat soluble vitamin supplements
- management of chest disease: physiotherapy, postural drainage, exercise, bronchodilators, aerosolized DNAase and inhaled hypertonic saline, antibiotics (e.g. cephalosporin, cloxacillin, ciprofloxacin, inhaled tobramycin depending on sputum C&S), lung transplantation
- genetic counselling

Complications

- respiratory failure, pneumothorax (poor prognostic sign), cor pulmonale (late), pancreatic fibrosis with DM, gallstones, cirrhosis with portal HTN, infertility (male)
- early death (current median survival in Canada is 46.6 yr)

CF Presenting Signs

CF PANCREAS

Chronic cough and wheezing
FTT

Pancreatic insufficiency (symptoms of malabsorption such as steatorrhea)

Alkalosis and hypotonic dehydration

Neonatal intestinal obstruction (meconium ileus)/Nasal polyps

Clubbing of fingers/Chest radiograph with characteristic changes

Rectal prolapse

Electrolyte elevation in sweat, salty skin

Absence or congenital atresia of vas deferens

Sputum with *S. aureus* or *P. aeruginosa* (mucoid)

- Pancreatic dysfunction – determined by 3 d fecal fat collection
- Genetics – useful where sweat chloride test is equivocal

Rheumatology

Evaluation of Limb Pain

Table 42. Differential Diagnosis of Limb Pain

Cause	<3 yr	3-10 yr	>10 yr
Trauma	x	x	x
Infectious			
Septic arthritis	x	x	x
Osteomyelitis	x	x	x
Inflammatory			
Transient synovitis	x	x	
JIA	x	x	x
Spondyloarthritis		x	x
SLE		x	x
Dermatomyositis		x	x
HSP		x	x
Anatomic/Orthopedic			
Legg-Calvé-Perthes disease		x	x
Slipped capital femoral epiphysis			x
Osgood-Schlatter disease			x
Neoplastic			
Leukemia	x	x	x
Neuroblastoma	x	x	x
Bone tumour		x	x
Hematologic			
Hemophilia (hemarthrosis)	x	x	x
Sickle cell anemia	x	x	x
Pain Syndromes			
Growing pains		x	x
Fibromyalgia		x	x
Complex regional pain syndrome			x

- must rule out infection, malignancy, and acute orthopedic conditions

History

- demographics (age, gender)
- pattern of onset and progression of symptoms (including acuity and chronicity)
- morning stiffness, limp/weight-bearing status, night pain
- joint involvement (type, distribution) \pm spine (axial) involvement
- extra-articular manifestations and systemic symptoms
- functional status – activities of daily living
- family history (arthritis, IBD, psoriasis, spondyloarthropathies, uveitis, bleeding disorders, sickle cell anemia)
- past medical illness, intercurrent infection, travel, sick contact history, joint injury

Physical Exam

- growth parameters
- screening examination (pediatric gait, arms, legs, spine exam)
- joint exam: inspection/palpation (swelling, erythema, warmth, tenderness, deformity), ROM
- adjacent structures (bone, tendon, muscle, skin)
- leg length
- neurologic exam

Investigations

- basic: CBC and differential, blood smear, ESR, CRP, x-ray
- as indicated: blood (ANA, RF, culture, viral/bacterial serology, CK, PTT, sickle cell screen, immunoglobulins, complement), urinalysis, synovial fluid (cell count, Gram stain, culture), TB skin test, imaging, bone marrow aspiration, slit lamp exam

**Red Flags for Limb Pain**

- Fever
- Pinpoint pain/tenderness
- Pain out of proportion to degree of inflammation
- Night pain
- Weight loss
- Erythema

Growing Pains

Epidemiology

- age 2-12 yr, M=F

Clinical Presentation

- diagnosis of exclusion
- intermittent, non-articular pain in childhood with normal physical exam findings
- pain at night, often bilateral and limited to the calf, shin, or thigh; typically short-lived
- relieved by heat, massage, mild analgesics
- child is well, asymptomatic during the day, no functional limitation
- possible family history of growing pains

Management

- lab investigations not necessary if typical presentation; reassurance and supportive management

Transient Synovitis of the Hip

- benign, self-limited inflammatory joint disorder, usually occurs after URTI, pharyngitis, AOM
 - key is to differentiate from septic arthritis

Epidemiology

- age 3-10 yr, M>F, more common on right side

Clinical Presentation

- afebrile or low-grade fever, pain typically occurs in hips, knees (referred from hip); painful limp but full ROM (pain not as pronounced as in joint or bone infections), child does not look “toxic”
 - pain is not disabling and gradually worsens over few days, can have sudden onset of symptoms
- symptoms resolve over 7-10 d

Investigations

- WBC within normal limits; ESR and CRP may be mildly elevated
- joint effusions may be seen on ultrasound
 - aspirate joint and examine synovial fluid if suspicious for septic arthritis
 - MRI if suspicious for osteomyelitis or periarticular pyomyositis
- diagnosis of exclusion

Treatment

- symptomatic and anti-inflammatory medications
 - usually resolves with 24-48 h

Complications

- Legg-Calve-Perthes Disease

Septic Arthritis and Osteomyelitis

- MEDICAL EMERGENCY
- see [Orthopedics, OR9](#)

Table 43. Microorganisms and Treatment Involved in Septic Arthritis/Osteomyelitis

Age	Pathogens	Treatment
Neonate	GBS, <i>S. aureus</i> , Gram negative bacilli	cloxacillin + gentamicin OR cloxacillin + cefotaxime
Infant (1-3 mo)	<i>Strep. spp.</i> , <i>Staph. spp.</i> , <i>H. influenzae</i> Pathogens as per neonate	cloxacillin + cefotaxime OR cefuroxime
Child	<i>S. aureus</i> , <i>S. pneumoniae</i> , GAS	Cefazolin OR cloxacillin OR clindamycin
Adolescent	As above; also <i>N. gonorrhoeae</i>	Ceftriaxone OR cefixime + azithromycin
Sickle cell disease	As above; also <i>Salmonella</i>	cefotaxime

GAS = group A *Strep.*; GBS = group B *Strep.*

Adapted from Tse SML, Laxer RM. *Pediatrics in Review* 2006;27:170-179

Juvenile Idiopathic Arthritis

- a heterogenous group of conditions characterized by persistent arthritis in children <16 yr
- diagnosis: arthritis in ≥1 joint(s); duration ≥6 wk; onset age <16 yr old; exclusion of other causes of arthritis; classification defined by features/number of joints affected in the first 6 mo of onset

Systemic Arthritis (Still's Disease)

- onset at any age, M=F
- once or twice daily fever spikes (>38.5°C) ≥2 d/wk with temperature returning below baseline; children usually acutely unwell during fever episodes
- extra-articular features: erythematous "salmon-coloured" maculopapular rash, lymphadenopathy, hepatosplenomegaly, leukocytosis, thrombocytosis, anemia, serositis
- arthritis may occur weeks to months later
- high ESR, CRP, WBC, platelet count

Oligoarticular Arthritis (1-4 joints)

- most common type of JIA
 - onset early childhood (<5 years of age), F>M
- persistent: affects no more than 4 joints during the disease course
- extended: affects more than 4 joints after the first 6 mo
- typically affects large joints: knee most common, elbows, wrists; hip involvement unusual
- ANA positive ~60-80%, RF negative
- screening eye exams for asymptomatic anterior uveitis (occurs in ~30%)
- complications: knee flexion contracture, quadriceps atrophy, leg-length discrepancy, growth disturbances, uveitis

Polyarticular Arthritis (5 or more joints)

- ANA positive in 50%, uveitis in 10%
- RF negative (usually negative)
 - onset: 2-4 yr and 6-12 yr, F>M
 - symmetrical involvement of large and small joints of hands and feet, TMJ, cervical spine
- RF positive
 - onset: late childhood/early adolescence, F>M
 - similar to the aggressive form of adult rheumatoid arthritis
 - severe, rapidly destructive, symmetrical arthritis of large and small joints
 - may have rheumatoid nodules at pressure points (elbows, knees)
 - unremitting disease, persists into adulthood

Enthesitis-Related Arthritis

- onset: late childhood/adolescence, M>F
- arthritis and/or enthesitis (inflammation at the site where tendons or ligaments attach to the bone)
- weight bearing joints, especially hip and intertarsal joints
- risk of developing ankylosing spondylitis in adulthood

Psoriatic Arthritis

- onset: 2-4 yr and 9-11 yr, F>M
- arthritis and psoriasis OR arthritis and at least two of:
 - dactylitis, nail pitting or other abnormalities, or family history of psoriasis in a 1st degree relative
 - asymmetric or symmetric small or large joint involvement

Management

- goals of therapy: eliminate inflammation, prevent joint damage, promote normal growth and development as well as normal function, minimize medication toxicity
- exercise to maintain ROM and muscle strength
- multidisciplinary approach: OT/PT, social work, orthopedics, ophthalmology, rheumatology
- 1st line drug therapy: NSAIDs, intra-articular corticosteroids
- 2nd line drug therapy: DMARDs (methotrexate, sulfasalazine, leflunamide), corticosteroids (acute management of severe arthritis, systemic symptoms of JIA, topical eye drops for uveitis), biologic agents (IL1, IL6 inhibition for systemic arthritis, TNF antagonist for polyarticular JIA)

Reactive Arthritis

- see [Rheumatology, RH24](#)
- arthritis (typically the knee) follows bacterial infection, especially with *Salmonella*, *Shigella*, *Yersinia*, *Campylobacter*, *Chlamydia*, and most commonly *Streptococcus* (post-streptococcal reactive arthritis)
- typically resolves spontaneously
- may progress to chronic illness or Reiter's syndrome (urethritis, conjunctivitis)

Lyme Arthritis

- see [Infectious Diseases, ID23](#)
- caused by spirochete *Borrelia burgdorferi*
- incidence highest among 5-10 yr olds
- do not treat children <8 yr old with doxycycline (may cause permanent tooth discoloration)

Systemic Lupus Erythematosus

- see [Rheumatology, RH11](#)
- autoimmune illness affecting multiple organ systems
- incidence 1/1,000, more commonly age >10, F:M = 10:1
- childhood-onset SLE vs. adult-onset SLE: children have more active disease, are more likely to have renal disease, and children receive more intensive drug therapy and have a poorer prognosis

Vasculitides

HENOCH-SCHÖNLEIN PURPURA

- most common vasculitis of childhood, peak incidence 4-10 yr, M:F = 2:1
- vasculitis of small vessels
- often have history of URTI 1-3 wk before onset of symptoms

Clinical Presentation

- clinical triad: 1) palpable purpura, 2) abdominal pain, 3) arthritis
- skin: palpable, non-thrombocytopenic purpura in lower extremities and buttocks, edema, scrotal swelling
- joints: arthritis/arthralgia involving large joints associated with painful edema
- GI: abdominal pain, GI bleeding, intussusception
- renal: microscopic hematuria, IgA nephropathy, proteinuria, HTN, renal failure in <5%

Investigation

- urinalysis (blood, protein creatinine ratio), serum (urea/electrolytes, creatinine, albumin, elevated IgA)
- skin/renal biopsy – IgA deposition
- ultrasound – intussusception/perforation, testicular pain/swelling
- rule out other autoimmune conditions/vasculitides

Management

- mainly supportive (e.g. elevation for edema)
- anti-inflammatory medications for joint pain, corticosteroids for select patients
- monitor for protein on urinalysis and hypertension every month for 6 mo, checking for renal disease, which may develop late (immunosuppressive therapy if severe)

Prognosis

- self-limited, resolves within 4 wk
- recurrence in about one-third of patients
- long-term prognosis dependent on severity of nephritis

KAWASAKI DISEASE

- acute vasculitis of unknown etiology (likely triggered by infection)
- medium-sized vasculitis with predilection for coronary arteries
- most common cause of acquired heart disease in children in developed countries
- peak age: 3 mo-5 yr; Asians > Blacks > Caucasians

Diagnostic Criteria

- fever persisting ≥ 5 d AND ≥ 4 of the following features
 1. bilateral, non-exudative conjunctival injection
 2. oral mucous membrane changes (fissured lips, strawberry tongue, injected pharynx)
 3. changes of the peripheral extremities
 - ♦ acute phase: extremity changes including edema of hands and feet or erythema of palms or soles
 - ♦ subacute phase: periungual desquamation
 4. polymorphous rash
 5. cervical lymphadenopathy >1.5 cm in diameter (usually unilateral)
- exclusion of other diseases (e.g. scarlet fever, measles)
- atypical Kawasaki disease: fever persisting ≥ 5 d and 2-3 of the above criteria
 - further evaluation dictated by CRP, ESR, and supplemental laboratory criteria

Management

- initial therapy: IVIG (2g/kg) and high (anti-inflammatory) dose of ASA
- once afebrile >48 h: low (anti-platelet) dose of ASA until platelets normalize, or longer if coronary artery involvement
- IVIG within 10 d of onset reduces risk of coronary aneurysm formation
- baseline 2D-Echo and follow-up periodic 2D-Echo (usually at 2, 6 wk)

Complications

- coronary artery vasculitis with aneurysm formation occurs in 20-25% of untreated children, $<5\%$ if receive IVIG within 10 d of fever
- 50% of aneurysms regress within 2 yr
- anticoagulation for multiple or large coronary aneurysms
- risk factors for coronary disease: male, age <1 or >9 yr, fever >10 d, Asian or Hispanic ethnicity, thrombocytopenia, hyponatremia

Common Medications

Table 44. Commonly Used Medications in Pediatrics

Drug Name	Dosing Schedule	Indications	Comments
acetaminophen	10-15 mg/kg/dose PO q4-6h prn	Analgesic, antipyretic	Not to exceed 60 mg/kg/d in neonates or 75 mg/kg/d in older children to a max of 4 g/d Causes hepatotoxicity at high doses
amoxicillin	80-90 mg/kg/d PO divided q8h	Otitis media	
dexamethasone	0.6 mg/kg PO x 1 0.6 mg/kg/d PO for 2 d	Croup Acute asthma	
fluticasone (Flovent [®])	Moderate dose – 250-500 μ g/d divided bid High dose – >500 μ g/d divided bid	Asthma	
ibuprofen	5-10 mg/kg/dose PO q6-8h	Analgesic, antipyretic	Cautious use in patients with liver impairment, history of GI bleeding or ulcers
iron	6 mg/kg/d elemental iron OD or divided tid	Anemia	SE: dark stool, constipation, dark urine
omeprazole	0.7-3.3 mg/kg/d (max dose 20 mg/d) OD or divided bid/tid	GERD	SE: headache, diarrhea, nausea, abdominal pain
ondansetron	0.15 mg/kg/dose (max dose 16 mg) q4-8h up to 3x	Post-operative N/V Gastroenteritis Cyclic vomiting	SE: QTc prolongation, orally disintegrating tablets contain phenylalanine (caution in PKU patients)
phenobarbital	3-5 mg/kg/d PO OD or bid	Seizures	SE: CNS depression
polyethylene glycol 3350 (PEG)	Disimpaction: 1-1.5 g/kg/d x 3 d Maintenance: starting dose at 0.4-1 g/kg		
prednisone/ prednisilone	1-2 mg/kg/d PO x 5 d 3-4 mg/kg/d PO then taper to 1-2 mg/kg/d PO once platelet count $>30 \times 10^9/L$ 60 mg/m ² /d PO	Asthma ITP Nephrotic syndrome	Oral prednisone is bitter tasting, consider using prednisilone
salbutamol (Ventolin [®])	0.01-0.03 mL/kg/dose in 3 mL NS via nebulizer q0.5-4h prn 100-200 μ g/dose prn, max 4-8 puffs frequency q4h	Acute asthma Maintenance treatment for asthma	Can cause tachycardia, hypokalemia, restlessness

Skin Lesions and Masses

Differential Diagnosis of Skin Lesions/Masses

- for background information and medical management (see [Dermatology, D5](#))
- for biopsy techniques, see [Skin Biopsy Types and Techniques, PL7](#)

Surgical Management of Malignant Skin Lesions

- surgical treatment for all malignant skin lesions involve total excision of the primary lesion
- excision margin of lesion depends on the type of lesion, the lesion diameter, and (for melanoma) the lesion depth
- for decisions regarding reconstruction using flaps or skin grafts, see [Reconstruction, PL11](#)

Precursors of Malignant Lesions

Table 1. Precursors

Basal Cell Carcinoma	Squamous Cell Carcinoma	Malignant Melanoma
Nevus sebaceous of Jadassohn	Actinic keratosis	Lentigo maligna
	Bowen's disease	Giant congenital nevus
	Bowenoid papulosis	Dysplastic nevus
	Leukoplakia	
	Erythroplasia	

Surgical Margins

Table 2. Surgical Margins for Basal Cell Carcinoma

Type of Lesion	Surgical Margins
Low Risk	3 mm
High Risk*	3-5 mm

*High risk features include: diameter and location (>20 mm trunk, >6 mm face, hands, and feet), poorly defined borders, recurrent lesion, poor differentiation, and type of lesion (e.g. morpheiform)

Table 3. Surgical Margins for Squamous Cell Carcinoma

Type of Lesion	Surgical Margins
Low Risk	4 mm
High Risk*	5-10 mm

*High risk features include: depth >2 mm, facial lesions, poorly defined borders, recurrent lesion, perineural invasion, poor differentiation, and type of lesion (e.g. morpheiform)

Table 4. Surgical Margins for Malignant Melanoma

Depth of Lesion	Surgical Margins
<i>In situ</i>	0.5 cm
<1 mm	1 cm
1.01-1.99 mm	1-2 cm
≥2 mm	2 cm

Basic Surgical Techniques

Sutures and Suturing

ANESTHESIA

- irrigate before injecting anesthetic, followed by debridement and more vigorous irrigation

Table 5. Toxic Limit and Duration of Action (1 cc of 1% solution contains 10 mg lidocaine)

	Without Epinephrine	With Epinephrine (vasoconstrictor, limits bleeding)
Lidocaine (Xylocaine®)*	5 mg/kg, lasts 45-60 min	7 mg/kg, lasts 2-6 h
Bupivacaine (Marcaine®) for longer analgesic effect	2 mg/kg, lasts 2-4 h	3 mg/kg, lasts 3-7 h

* Lidocaine toxicity symptoms include: circumoral numbness, light-headedness, and drowsiness followed by tremors and seizures. Cardiac and respiratory signs are late findings

- for example, when using 1% lidocaine without epinephrine in a 70 kg patient:
 - toxic limit = 5 mg x 70 kg = 350 mg
 - max bolus injection = 350 mg ÷ 10 mg/cc = 35 cc (may add more after 30 min)

IRRIGATION AND DEBRIDEMENT

- irrigate copiously with a physiologic solution such as Ringer's lactate or normal saline to remove surface clots, foreign material, and bacteria
- use a 19 gauge needle and 35 cc syringe to generate ~25-35 psi when irrigating
- debride all obviously devitalized tissue; irregular or ragged wounds must be excised to produce sharp wound edges that will assist healing when approximated
- wounds left unapproximated ≥8 h should be debrided and copiously irrigated to ensure wound edges are optimized for healing
- there is high risk of infection for any wound closed primarily after 8 h

SUTURES

- use of a particular suture material is highly dependent on surgeon preference; however, skin should be closed with a non-absorbable material when traumatic mechanisms are involved

Table 6. Suture Materials: Absorbable vs. Non-absorbable and Monofilament vs. Multifilament

Suture Materials	Uses	Examples	Notes
Absorbable	Deep sutures under short-term tension Skin closure in children	Plain gut®, Vicryl®, Polysorb®, Biosyn®, Monocryl®, Caprosyn®, chromic gut, fast absorbing gut	Loses at least 50% of their strength in 4 wk; eventually absorbed
Non-absorbable	Skin closure Sites of long-term tension	Nylon, polypropylene (Prolene®), stainless steel, silk, ticon, ethibond	Lower likelihood of wound dehiscence, more difficult to tie, makes track marks
Monofilament	Everyday use and optimal for contaminated and infected wounds (lower likelihood of bacterial trapping in suture material)	Monosof®, Monocryl®, Biosyn®, Prolene®	Slides through tissue with less friction; more memory/stiffness; more difficult to tie; requires multiple throws (lower knot security)
Multifilament	AVOID in contaminated wounds (increased likelihood of bacterial trapping)	Vicryl® and Silk, Ticon, Ethibond	Less memory/stiffness, thus easier to work with (higher knot security)

BASIC SUTURING TECHNIQUES

Basic Suture Methods

- simple interrupted: can be used in almost all situations
- sub-cuticular: good cosmetic result but weak, used in combination with deep sutures; not used in trauma
- vertical mattress: for areas difficult to evert (e.g. volar hand)
- horizontal mattress: everting, time-saving
- continuous over and over (i.e. "running", "baseball stitch"): time-saving, good for hemostasis

Other Skin Closure Materials

- tapes: may be indicated for superficial wounds and those with opposable edges. Tape cannot be used on actively bleeding wounds. When placed across the incision, will prevent surface marks and can be used primarily or after surface sutures have been removed
- skin adhesives: e.g. 2-octylcyanoacrylate (e.g. Dermabond®) works well on small areas without much tension or shearing; may cause irreversible tattooing
- staples: steel-titanium alloys that incite minimal tissue reaction (healing is comparable to wounds closed by suture)

Traumatic tattoos are permanent discolourations resulting from new skin growth over foreign material or dirt left behind in the dermis. Copious irrigation and debridement should be done ASAP in order to prevent traumatic tattoos, as they are very difficult to treat later

© Baseer Khan, Tabby Lulham 2010

Figure 13. Basic suture methods

Steps to Ensuring Good Suturing Cosmesis

- Incisions should be made along relaxed skin tension lines
- Attain close apposition of wound edges
- Minimize tension on skin by closing in layers
- Evert wound edges
- Use appropriately sized suture for skin closure (5-0, 6-0 on face; 3-0, 4-0 elsewhere)
- Ensure equal width and depth of tissue on both sides
- Remove sutures within 5-7 d from the face, 10-14 d from scalp/torso/extremities

Excision

- plan your incision along relaxed skin tension lines to minimize appearance of scar
- use elliptical incision to prevent “dog ears” (heaped up skin at end of incision), so the length of the ellipse should be approximately 3x the width
- if needed, undermine skin edges to decrease wound tension
- use layered closure including dermal sutures (decreases tension)

Relaxed Skin Tension Lines

Natural skin/wrinkle lines with minimal linear tension. Placing incisions parallel to relaxed skin tension lines minimizes widening/hypertrophy and helps to camouflage scars. Relaxed skin tension lines are usually parallel to any existing wrinkle lines and perpendicular to the orientation of underlying muscle fibres

Skin Biopsy Types and Techniques

SHAVE BIOPSY

- used for superficial lesions where sampling of the full thickness of the dermis is not necessary or practical
- most suitable lesions for shave biopsies are benign lesions either elevated above the skin or have pathology confined to the epidermis (e.g. seborrheic or actinic keratoses, skin tags, and warts)
- high risk of recurrence with shave biopsy for any lesions, including actinic or seborrheic keratoses
- rapid, requires little training, and does not require sutures for closure
- heals by secondary intent (moist dressings should be used)
- should not be used for pigmented lesions – an unsuspected melanoma cannot be properly staged if partially removed

NEEDLE BIOPSY

- 21 G for lymph node biopsy
- Trucut® needle biopsy for breast masses suspected for carcinoma

INCISIONAL BIOPSY

- can be a punch biopsy, an ellipse within the lesion, or a narrow margin excision of the lesion
- gives pathologists a portion of the lesion and the border with normal skin
- punch biopsies involve the removal of a core-shaped piece of tissue to allow sampling of the deep dermis; performed with round, disposable knives ranging in diameter from 2-10 mm
- punch biopsy wounds can be closed with suture or left to heal by secondary intention. Punches greater than 3 mm may produce scarring and are best closed with one or two sutures
- punch biopsies have a low incidence of infection, bleeding, non-healing, and significant scarring

EXCISIONAL BIOPSY

- performed for lesions that require complete removal for diagnostic purposes
- performed for lesions that cannot be adequately punch biopsied due to size or depth
- for small pigmented lesions and atypical moles; if concerned about melanoma, can do a narrow margin excision for the diagnosis and treatment of small pigmented lesions and atypical moles
- best for small lesions that are easily removed and primarily closed
- requires the greatest amount of expertise and time
- always requires sutures for closure

TECHNIQUE

General

- all shave and punch biopsies performed in clinic are done using aseptic technique, but are not sterile
- sterile gloves are indicated for biopsies and excisions in all patients

Preparing the Site

- common skin antiseptics (Betadine®, chlorhexidine) can be used to prepare the biopsy site
- chlorhexidine is used in concentrations ranging from 0.5-4%. The higher concentration cannot be used on the face, as it could get into the eyes or ears and may burn or cause damage. Most chlorhexidine preps also contain alcohol, which can be flammable, so allow to dry before the biopsy and certainly before using any cautery
- Betadine® (7.5% povidone-iodine) may be safer for the head and neck (as to avoid the above problems with chlorhexidine) and around the eyes and ears
- mark the intended lesion and surgical margins with a surgical marker, since they may be temporarily obliterated following injection of the anesthetic
- for all biopsies, a sterile drape technique is indicated. A fenestrated surgical drape is placed around the biopsy site after the area is cleansed and anesthetized

Anesthesia

- most commonly used local anesthetic is 1% or 2% lidocaine (with epinephrine)
- small amounts of epinephrine are added to constrict blood vessels, decrease bleeding, prolong anesthesia, and limit lidocaine toxicity. The local with epinephrine can be injected directly into the lesion
- local anesthetics with epinephrine may be used anywhere in the body, including the digits (except if the digits have been significantly injured and could have vascular compromise – e.g. saw injury)
- epinephrine should only be avoided in patients with history of vascular compromise if injecting into an area that is compromised

Figure 14. Incision of lesions along relaxed skin tension lines

Wounds

- wound: disruption of the normal anatomical relationships of tissue as a result of injury

Types of Wounds

- laceration: cut or torn tissue
- abrasion: superficial skin layer is removed, variable depth
- contusion: injury caused by forceful blow to the skin and soft tissue; entire outer layer of skin intact, yet injured
- avulsion: tissue/limb forcefully separated from surrounding tissue, either partially or fully; “de-gloving”
- puncture wounds: cutaneous opening relatively small as compared with depth (e.g. needle), including bite wounds
- crush injuries: caused by compression
- burns: thermal, chemical, electrical
- ulcers

Principles of Wound Healing

Table 7. Factors Influencing Wound Healing

Local (reversible/controllable)	General (often irreversible)
Mechanical (local trauma, significant crush, avulsion, tension)	Age (affects healing rate)
Blood supply (ischemia/circulation)	Nutrition (protein, vitamin C, O ₂)
Temperature	Tobacco smoking
Technique and suture materials	Alcohol abuse
Retained foreign body	Chronic illness (e.g. DM, cancer, CVD, renal failure)
Infection	Immunosuppression (steroids, chemo)
Venous HTN	Tissue irradiation
Peripheral vascular disease	Genetic predisposition to abnormal healing (e.g. hypertrophic or keloid scarring, collagen vascular disease)
Hematoma/seroma (↑ infection rate)	Skin type

STAGES OF WOUND HEALING

- growth factors released by tissues play an important role
- scar is mature once it has completed the final stage, usually after 1-2 yr

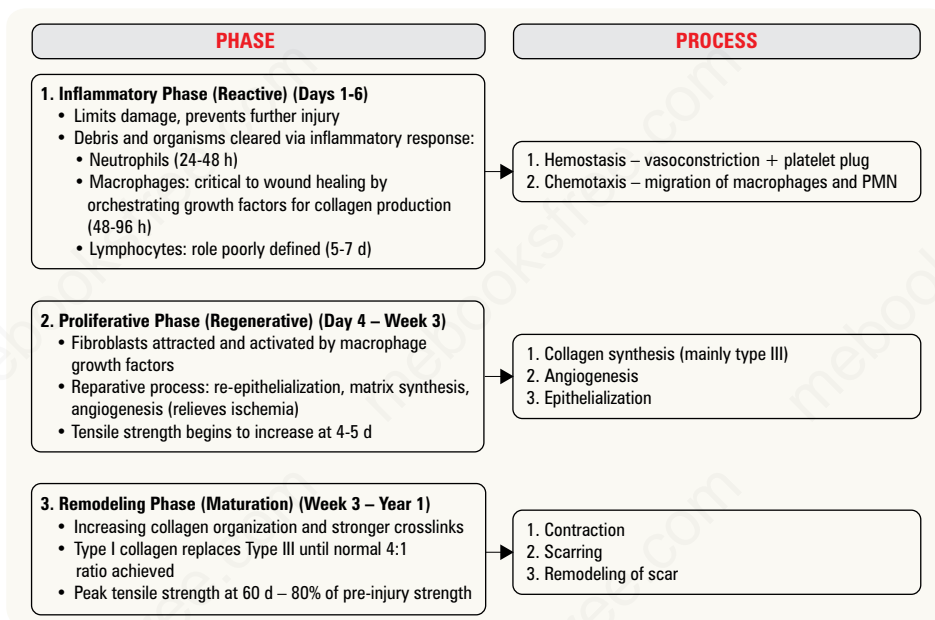

Figure 15. Stages of wound healing

TYPES OF WOUND HEALING

Primary (1°) Healing (First Intention)

- **definition:** wound closure by direct approximation of edges within hours of wound creation (i.e. with sutures, staples, skin graft, etc.)
- **indication:** recent (<6 h, longer with facial wounds), clean wounds
- **contraindications:** animal/human bites (except on face), crush injuries, infection, long time lapse since injury (>6-8 h), retained foreign body

Secondary (2°) Healing/ Spontaneous Healing (Second Intention)

- **definition:** wound left open to heal spontaneously (epithelialization occurs at 1 mm/d from wound margins in concentric pattern, contraction [myofibroblasts], and granulation) – maintained in inflammatory phase until wound closed; requires dressing changes; inferior cosmetic result
- **indication:** when 1° closure not possible or indicated (see *Primary Healing*)

Myofibroblasts are the cells responsible for wound contraction; they do this at a rate of less than 0.75 mm/d

Tertiary (3°) Healing/ Delayed Primary Healing (Third Intention)

- **definition:** intentionally interrupt healing process (e.g. with packing, sharp debridement), then wound can be closed primarily at 4-10 d post-injury after granulation tissue has formed and there is <105 bacteria/gram of tissue
- **indication:** contaminated (high bacterial count), long time lapse since initial injury, severe crush component with significant tissue devitalization, closure of fasciotomy wounds
- prolongation of inflammatory phase decreases bacterial count and lessens chance of infection after closure

ABNORMAL HEALING

Hypertrophic Scar

- **definition:** scar remains roughly within boundaries of original scar
- red, raised, widened, frequently pruritic
- common sites: back, shoulder, sternum
- **treatment:** scar massage, pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision if other options fail (however, may still recur)
- often improve slowly over time

Keloid Scar

- **definition:** scar grows outside boundaries of original scar
- red, raised, widened, frequently pruritic
- caused by:
 - genetic factors (highest rates in African Americans, Asians)
 - endocrine factors
 - excess tension on wound or delayed closure (as in burn wounds)
- common sites: central chest, back, shoulders, deltoid, ear, angle of mandible
- **treatment:** multimodal therapy including: pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision with post-surgical management if other options fail (however, there is a high chance of recurrence), fractional carbon dioxide ablative laser, radiation

Spread Scar

- characterized by having exactly the same order of collagen fibres as normal scars
- clinically, a typical spread scar is flat, wide, and often dented
- **treatment:** surgical excision and closure

Chronic Wound

- wound fails to achieve primary wound healing within 4-6 wk
- common chronic wounds include: diabetic, pressure, and venous stasis ulcers
- **treatment:** may heal with meticulous wound care; may also require surgical intervention
- Marjolin's ulcer: squamous cell carcinoma arising in a chronic wound secondary to genetic changes caused by chronic inflammation → always consider biopsy of chronic wound

Infected Wounds

Definitions

- the presence of bacteria within a wound may be divided into 4 categories:
- contamination: the presence of non-replicating microorganisms within a wound
- colonization: the presence of replicating microorganisms within a wound
- critical colonization: increasing bacterial burden; have delayed healing but may not exhibit classic signs of infection
- infection: the presence of >10⁵ microorganisms in a wound without intact epithelium or small amounts of a very virulent organism (e.g. GBS); have delayed healing and exhibit classic signs of infection
 - signs of infection: redness, swelling, pain, clinically unwell

Risk Factors for Infection

- Virulence of the infecting microorganism
- Amount of bacteria present
- Host resistance
- Immunocompromised host

Management of Acute Contaminated Wound (<24 h)

- cleanse and irrigate open wound with physiologic solution (NS or RL) using sufficient pressure
- evaluate for injury to underlying structures (vessels, nerve, tendon, and bone)
- control active bleeding; previously closed wounds may require suture removal in order to drain any pus and allow for thorough irrigation and debridement
- debridement: removal of foreign material, devitalized tissue, old blood
 - surgical debridement: blade and irrigation if indicated
- systemic antibiotics are commonly indicated for obvious infection. Risk factors include: wound >8 h, severely contaminated, human/animal bites, immunocompromised, involvement of deeper structures (e.g. joints, fractures)
- tetanus prophylaxis (see Table 8 and Figure 16)
- ± post-exposure treatment of:
 - hepatitis B, HIV, hepatitis C (if titres confirmed at 6 mo)
- re-evaluate in 24-48 h for signs of superficial or deep infection
 - if evidence of infection (i.e. erythema, warmth, pain, discharge), open infected portion of wound by removing sutures, swab sample for culture and sensitivity, irrigate wound and allow healing by secondary intention

Management of Late Contaminated Wounds (>24 h, including ulcers)

- tetanus prophylaxis (see Table 8 and Figure 16)
- irrigation and debridement
 - traumatic tattooing can occur if foreign materials left in wound
- systemic antibiotics
- topical antimicrobials: beneficial for minor wounds, but no additional benefit for wounds requiring systemic antibiotics. May aid in healing of chronic wounds
- closure: final closure via secondary intention (most common), delayed wound closure (3° closure), skin graft, or flap; successful closure depends on bacterial count of $\leq 10^5/cm^3$ prior to closure and frequent dressing changes

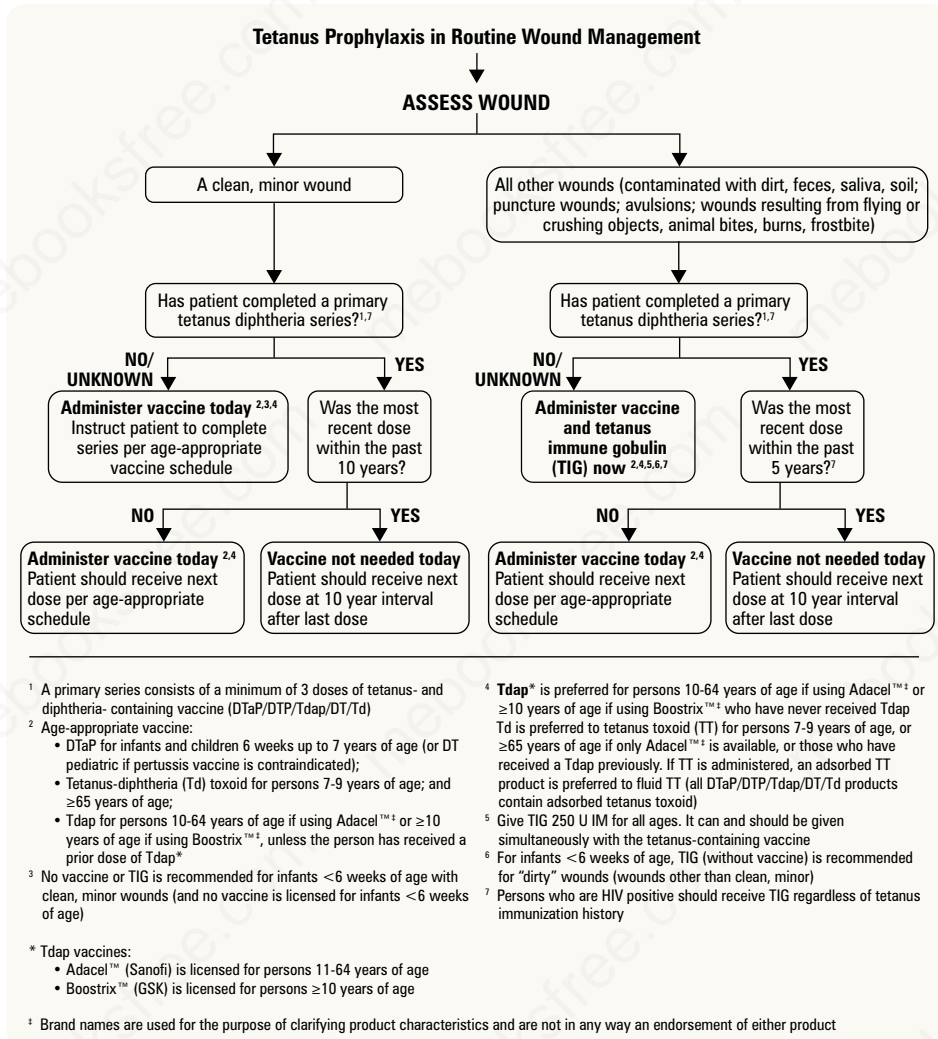

Figure 16. Tetanus immunization recommendations

Table 8. Risks for Tetanus Infection

Wound Characteristics	Tetanus-Prone	Not Tetanus-Prone
Time since injury	>6 h	<6 h
Depth of injury	>1 cm	<1 cm
Mechanism of Injury	Crush, burn, gunshot, frostbite, puncture through clothing, farming injury	Sharp cut (e.g. clean knife, clean glass)
Devitalized tissue	Present	Not present
Contamination (e.g. soil, dirt, saliva, grass)	Yes	No
Retained foreign body	Yes	No

BITES

- see [Emergency Medicine, ER47](#)

**Dog and Cat Bites**

- pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*
- **investigations**
 - radiographs prior to therapy to rule out foreign body (e.g. tooth) or fracture
 - culture for aerobic and anaerobic organisms, Gram stain
- **treatment:** Clavulin® (amoxicillin + clavulanic acid) 500 mg PO q8h started immediately
 - consider rabies prophylaxis if animal has symptoms of rabies or unknown animal
 - ♦ ± rabies Ig (20 IU/kg around wound, or IM) and 1 of the 3 types of rabies vaccines (1.0 mL IM in deltoid, repeat on days 3, 7, 14, 28)
- aggressive irrigation with debridement
- healing by secondary intention is mainstay of treatment
- only consider primary closure for bite wounds on the face; otherwise primary closure is contraindicated
- contact Public Health if animal status unknown

Human Bites

- pathogens: *Staphylococcus* > β -hemolytic *Streptococcus* > *Eikenella corrodens* > *Bacteroides*
- mechanism: most commonly over dorsal MCP from a punch in mouth; “fight-bite”
- serious, as mouth has 10⁹ microorganisms/mL, which get trapped in joint space when fist unclenches and overlying skin forms an air-tight covering ideal for anaerobic growth – can lead to septic arthritis
- **investigations**
 - radiographs prior to therapy to rule out foreign body (e.g. tooth) or fracture
 - culture for aerobic and anaerobic organisms, Gram stain
- **treatment**
 - urgent surgical exploration of joint, drainage, and debridement of infected tissue
 - wound must be copiously irrigated
 - Clavulin® 500 mg PO q8h or (if penicillin allergy) clindamycin 300 mg PO q6h + ciprofloxacin 500 mg PO q12h + secondary closure
 - splint

Dressings

- dressing selection depends on the wound characteristics and surgeon preference
 - as the wound progresses through healing, it will require different types of dressings; therefore, routine inspection is recommended
 - ♦ principles of dressing clean vs. infected wounds
 - clean wounds can be dressed with non-adherent dressing (which is non-adhering to epithelializing tissue); requires secondary dressing
 - infected wounds may need debridement and antibiotics and can be dressed with iodine gauze, silver-containing dressings, or antimicrobial dressings
 - ♦ moist vs. dry wounds
 - purpose of dressings should be to promote moist wound healing i.e. moistening dry wounds or drying (removing excess exudate/blood) wet wounds
 - ♦ wide-based vs. cavitory/tunnelling wounds
 - cavitory or tunnelling wounds (i.e. through a fascial layer) can be packed with saline-soaked ribbon gauze (non-infected) or Betadine®-soaked ribbon gauze (infected)

Negative-pressure wound therapy or vacuum-assisted closure (VAC) uses sealed vacuum dressings that suction wound fluid and promote increased blood flow to enhance the healing process. VACs may be placed under deep wounds or to enhance skin graft take

Table 9. Recommended Dressings for Wound Type

Wound Depth	Exudate Level	Dressing Material
Superficial	Lightly exuding	Films (Opsite®), hydrogels (Intrasite®, Nu-gel®, Duoderm®)
	Any exudate level	Contact layers
Deep	Light to moderately exuding wounds	Amorphous gels, hydrogels, hydrocolloids (Duoderm®, Tegaderm®), collagen, hypertonic saline gauze (Mesalt®)
	Moderately to heavily exuding wounds	Foams (Mepilex®, Allevyn®), alginates (Sorbsan®, Kalto-stat®), hypertonic saline gauze, hydrofibre (Aquacel®)

Adapted from Grabb & Smith's Plastic Surgery, 6th ed. Chapter 3, Table 3.3

Reconstruction

RECONSTRUCTION LADDER

Definition

- an approach to wound management with successively more complex methods of treatment
- surgeons should start with the least complex method and progressively increase in complexity as appropriate

SKIN GRAFTS

Definition

- tissue composed of epidermis and varying degrees of dermis, that does not carry its own blood supply. Survival requires the generation of new blood vessels from the recipient site bed

Donor Site Selection

- must consider size, hair pattern, texture, thickness of skin, and colour (facial grafts best if taken from "blush zones" above clavicle e.g. pre/post auricular or neck)
- partial thickness grafts usually taken from inconspicuous areas (e.g. buttocks, lateral thighs, etc.)

Partial Thickness Skin Graft Survival

- 3 phases of skin graft "take"
 1. plasmatic imbibition: diffusion of nutrition from recipient site (first 48 h)
 2. inosculation: vessels in graft connect with those in recipient bed (d 2-3)
 3. neovascular ingrowth: graft revascularized (d 3-5)
- requirements for graft survival
 - well-vascularized bed (recipient site). Unsuitable beds include: bone, tendon, heavily irradiated, infected wounds, etc.
 - good contact between graft and recipient bed. Staples, sutures, splinting, and pressure dressings are used to prevent movement/ shearing of graft and hematoma or seroma formation
 - low bacterial count at recipient site ($<10^5/\text{cm}^3$, to prevent infection)
- common reasons for graft loss: hematoma/seroma, infection, mechanical force (e.g. shearing, pressure)

Classification of Skin Grafts

1. by species
 - autograft: from same individual
 - allograft (homograft): from same species, different individual
 - xenograft (heterograft): from different species (e.g. porcine)
2. by thickness: see Table 10

Figure 17. Reconstructive ladder - in order of increasing complexity

Table 10. Skin Grafts

	Split Thickness Skin Graft	Full Thickness Skin Graft
Definition	Epidermis and part of dermis	Epidermis and all of dermis
Donor Site	More sites	Donor sites limited by the ability to use primary closure
Healing of Donor Site	Re-epithelialization via dermal appendages in graft and wound edges	Primary closure
Re-Harvesting	~10 d (faster on scalp)	N/A
Graft Take	More reliable and better survival; shorter nutrient diffusion distance	Lower rate of survival (thicker, slower vascularization)
Contraction*	Less 1° contraction, greater 2° contraction (less with thicker graft)	Greater 1° contraction, less 2° contraction
Aesthetic	Poor	Good
Comments	Can be meshed for greater area Allows for extravasation of blood/serum	May use on face and fingers
Advantages	Takes well in less favourable conditions Can cover a larger area Can be meshed for greater area Allows for extravasation of blood/serum Large number of donor sites	Resists contraction, better colour match May use on face and fingers
Disadvantages	Contracts significantly, abnormal pigmentation, high susceptibility to trauma	Requires well vascularized bed
Uses	Large areas of skin, granulating tissue beds	Face (colour match), site where thick skin or decreased contracture is desired (e.g. finger)

*Primary: immediate reduction in size upon harvesting; Secondary: reduction in size once graft placed on wound bed and healing has occurred

Meshed Grafts (split thickness grafts can be meshed after harvest by a mesher to a variety of ratios)

- **advantages**
 - prevents accumulation of fluids (e.g. hematoma, seroma)
 - covers a larger area
 - best for contaminated recipient site
- **disadvantages**
 - poor cosmesis (“alligator hide” appearance)
 - has significant contraction

OTHER GRAFTS

Table 11. Various Tissue Grafts

Graft Type	Use	Preferred Donor Site
Bone	Repair rigid defects	Cranial, rib, iliac, fibula, scapula
Cartilage	Restore contour of ear and nose	Ear, nasal septum, costal cartilage
Tendon	Repair or replace a damaged tendon	Palmaris longus, plantaris (present in 85% population)
Nerve	Conduit for regeneration across nerve gap	Sural, antebraichial cutaneous, medial brachial cutaneous
Vessel	Bridge vascular gaps	Forearm or foot vessels for small vessels, saphenous vein for larger vessels
Dermis	Contour restoration (± fat for bulk)	Thick skin of buttock or abdomen
Fat	Contour restoration	Abdomen, any area with fat available
Nipple	To create a new nipple on a reconstructed breast	Nipple

FLAPS

- **definition:** tissue of varying composition (skin and fat, muscle and fat, bone and fat, muscle only, etc.), that has a known blood supply (random, pedicled, or named); not dependent on neovascularization, unlike a graft
- **may consist of:** skin, subcutaneous tissue, fascia, muscle, tendon, bone, other tissue (e.g. omentum)
- **classification:** based on tissue composition, blood supply to skin (random, axial), and location of the donor site (local, regional, distant)
- **indications for flaps**
 - replaces tissue loss due to trauma or surgery (reconstruction)
 - provides skin and temporary soft tissue coverage through which surgery can be carried out later
 - to aid healing or treatment of infection by providing vascularized tissue to a poorly vascularized bed
- **complications:** flap loss due to hematoma, seroma, infection, poor flap design, extrinsic compression (dressing too tight) or vascular failure/thrombosis, fat necrosis (in free and pedicled flaps)

Random Pattern Flaps

- blood supply by dermal and subdermal plexus to skin and subdermal tissue with random vascular supply
- limited length:width ratio to ensure adequate blood supply (typically 3:1 in the head and neck, 1-2:1 elsewhere)
- flap choice is often a combination of available tissue, type of tissue needed, location of reconstruction site with respect to donor site, blood supply, ability to close the donor site and surgeon preference
- **types**
 - **rotation:** semicircular tissue rotated around a pivot point for defect closure; commonly used on sacral pressure sores, scalp, and cheek defects
 - **transposition:** tissue is transposed (i.e. lifted up from its native location and brought into the defect) around a pivot point from one location to another; commonly used on certain areas of the face using adjacent areas of excess skin laxity
 - **Z-plasty:** two triangular flaps are repositioned; used to reorient a scar, lengthen the line of a scar, or to break up a scar
 - **advancement flaps (V-Y, Y-V):** defect is closed with uni-directional tissue advancement
 - ♦ **single/bipedicle V-Y flaps:** wounds with lax surrounding tissue; the pedicle is the deep tissue underlying the flap

Figure 18. Wound care flaps – random pattern

Axial Pattern Flaps (Arterialized)

- flap contains a well-defined artery and vein
- allows greater length:width ratio (5-6:1)
- **types**
 - **peninsular flap:** skin and vessel intact in pedicle
 - **island flap:** vessel remains intact, but is skeletonized such that the pedicle is better defined
 - **free flap:** vessel is cut and re-anastomosed in a different anatomical location by microsurgical techniques
- can be sub-classified according to tissue content of flap
 - e.g. musculocutaneous/myocutaneous (e.g. transverse rectus abdominal myocutaneous) vs. fasciocutaneous

Free Flaps

- transplanting expendable donor tissue from one part of the body to another by isolating and dividing a dominant artery and vein to a flap, and performing a microsurgical anastomosis between these and the vessels in the recipient wound
- survival rates >95%
- **types:** muscle and skin (common), bone, jejunum, omentum, fascia
- e.g. radial forearm, scapular, latissimus dorsi

Table 12. Characteristics of Healthy Free Flap

Characteristic	Normal	Arterial Insufficiency	Venous Insufficiency
Colour	Pink	Pale	Purple or blue
Temperature	Warm	Cool	Warm or cool
Arterial Pulse (Doppler)	+	-	±
Turgor	Soft, but with some firmness	Decreased tissue firmness	Increased (tissue firmness with tissue stiffness)
Capillary Refill	2-5 s	>5 s	<2 s

Soft Tissue Infections

Table 13. Classification of Soft Tissue Infections by Depth

Erysipelas	Superficial, with upper dermis and superficial lymphatics involvement
Cellulitis	Full thickness of skin with subcutaneous tissue involvement
Fasciitis	Fascia
Myositis	Muscle

Erysipelas

Definition

- acute skin infection that is more superficial than cellulitis

Etiology

- typically caused by Group A β -hemolytic *Streptococcus*

Clinical Features

- intense erythema, induration, and **sharply demarcated borders** (differentiates it from other skin infections)

Treatment

- penicillin or first-generation cephalosporin (e.g. cefazolin or cephalexin)

Cellulitis

Definition

- non-suppurative infection of skin and subcutaneous tissues

Etiology

- skin flora are most common organisms: *S. aureus*, β -hemolytic *Streptococcus*
- immunocompromised: Gram-negative rods and fungi

Clinical Features

- source of infection
 - trauma, recent surgery
 - PVD, DM – cracked skin in feet/toes
 - foreign bodies (IV, orthopedic pins)
- systemic symptoms (fever, chills, malaise)
- pain, tenderness, edema, erythema with poorly defined margins, regional lymphadenopathy
- can lead to ascending lymphangitis (visible red streaking in skin proximal to area of cellulitis)

Investigations

- CBC, blood cultures
- culture and Gram stain a collection/aspirate from wound if open wound
- plain radiographs show soft tissue edema only

Treatment

- antibiotics: first line – cephalexin 500 mg PO q6h or cloxacillin 500 mg PO q6h x 7 d; if complicated (e.g. lymphangitis, DM, severe infection, oral antibiotic therapy failure), consider IV cefazolin 1-2 g q8h or IV cloxacillin, IV penicillin. All patients should have reassessment in 48 h for resolution if on an oral antibiotic
- outline area of erythema to monitor success of treatment
- immobilize and splint (hands)

Necrotizing Fasciitis

Definition

- rapidly spreading, very painful infection of the fascia with necrosis of surrounding tissues
- some bacteria create gas that can be felt as crepitus and can be seen on x-rays
- infection spreads rapidly along deep fascial plane and is limb- and life-threatening

Etiology

- Type I: polymicrobial (less aggressive)
- Type II: monomicrobial, usually β -hemolytic *Streptococcus*

Clinical Features

- pain out of proportion to clinical findings and beyond border of erythema
- edema, tenderness, ± crepitus (subcutaneous gas from anaerobes), ± flu-like symptoms (e.g. nausea, fever, diarrhea, dizziness, malaise)
- overlying skin changes including blistering and ecchymoses
- patients may look deceptively well at first, but may rapidly become very sick/toxic
- late findings
 - skin turns dusky blue and black (secondary to thrombosis and necrosis)
 - induration, formation of bullae
 - cutaneous gangrene, subcutaneous emphysema

Investigations

- a clinical diagnosis
- CT scan only if suspect it is not necrotizing fasciitis (looking for abscess, gas collection, myonecrosis and possible source of infection)
- severely elevated CK: usually means myonecrosis (late sign)
- bedside incision, exploration, and incisional biopsy when ruling out conditions, clinical presentation is not supportive, or difficult exam
- during incisional biopsy, often see “dish water pus” (Group A infection) and a hemostat easily passed along fascial plane (fascial biopsy to rule out in equivocal situations)

Treatment

- vigorous resuscitation (ABCs)
- urgent surgical debridement: remove all necrotic tissue, copious irrigation with plans for repeat surgery in 24-48 h
- IV antibiotics: as appropriate for clinical scenario; consider penicillin 4 million IU IV q4h and/or clindamycin 900 mg IV q6h until final cultures available (the combination can be synergistic if Group A strep)
- urgent consultation with infectious disease specialist is recommended

Necrotizing Soft-Tissue Infection: Diagnosis and Management

Clin Infect Dis (2007) 44 (5): 705-710

Summary: Necrotizing soft-tissue infections (NSTIs) are highly lethal. Establishing the diagnosis of NSTI can be the main challenge in treating patients with NSTI. The mainstay of treatment is early and complete surgical debridement, combined with antimicrobial therapy, close monitoring, and physiologic support. Novel therapeutic strategies, including hyperbaric oxygen and intravenous immunoglobulin, have been described, but their effect is controversial. Identification of patients at high risk of mortality is essential for selection of patients that may benefit from future novel treatments and for development and comparison of future trials.

Ulcers

Lower Limb Ulcers

Traumatic Ulcers (Acute)

- failure of wound to heal, usually due to compromised blood supply and unstable scar, secondary to pressure or bacterial colonization/infection
- usually over bony prominence ± edema ± pigmentation changes ± pain
- **treatment:** involvement of vascular surgery. Any debridement of ulcer and compromised tissues must be preceded by ABIs and vascular Doppler. Ulcers or compromised tissues left to heal via secondary intention with dressings may need reconstruction with local or distant flap in select cases, vascular status of limb must be assessed clinically and via vascular studies (i.e. ABI, duplex Doppler)

Non-Traumatic Ulcers (Chronic)

Table 14. Venous vs. Arterial vs. Diabetic Ulcers

Characteristic	Venous (70% of vascular ulcers)	Arterial	Diabetic
Cause	Valvular incompetence Venous HTN	2° to small and/or large vessel disease (be aware of risk factors)	Peripheral neuropathy: decreased sensation Atherosclerosis: microvascular disease
History	Dependent edema, trauma Rapid onset ± thrombophlebitis, varicosities	Arteriosclerosis, claudication Usually >45 yr Slow progression	DM Peripheral neuropathy Trauma/pressure
Common Distribution	Medial malleolus (“Gaiter” locations)	Distal locations (e.g. lower limb, feet)	Pressure point distribution (more likely metatarsal heads)
Appearance	Yellow exudates Granulation tissue Varicose veins Brown discolouration of surrounding skin	Pale/white, necrotic base ± dry eschar covering	Necrotic base
Wound Margins	Irregular	Even (“punched out”)	Irregular or “punched out” or deep
Depth	Superficial	Deep	Superficial/deep
Surrounding Skin	Venous stasis discolouration (brown)	Thin, shiny, dry skin; hairless, cool	Thin, dry skin ± hyperkeratotic border Hypersensitive/ischemic

ABI in diabetics can be falsely normal due to incompressible arteries secondary to plaques/calcification

Table 14. Venous vs. Arterial vs. Diabetic Ulcers (continued)

Characteristic	Venous (70% of vascular ulcers)	Arterial	Diabetic
Pulses	Normal distal pulses	Decreased or no distal pulses	Decreased pulses likely (take caution in calcified vessels)
Vascular Exam	ABI >0.9 Doppler; abnormal venous system	ABI <0.9 Pallor on elevation, rubor on dependency Delayed venous filling	ABI is inaccurately high (due to PVD) Usually associated with arterial disease (microvascular/macrovacular disease)
Pain	Moderately painful Increased with leg dependency, decreased with elevation No rest pain	Extremely painful Decreased with dependency, increased with leg elevation and exercise (claudication) Rest pain	Painless (if neuropathy) No claudication or rest pain Associated paresthesia, anesthesia
Treatment	Leg elevation, rest Compression at 30 mmHg (stockings or elastic bandages) Moist wound dressings ± topical, systemic antibiotics if infected ± skin grafts	Rest, no elevation, no compression Moist wound dressing ± topical and/or systemic antibiotics if infected Modify risk factors (smoking, diet, exercise, etc.) Vascular surgical consultation (angioplasty or bypass) Treat underlying conditions (DM, proximal arterial occlusion, etc.)	Control DM Careful wound care Foot care Orthotics, off loading Early intervention for infections (topical and/or systemic antibiotics if infected) Vascular surgical consultation

Pressure Ulcers

Common Sites

- over bony prominences; 95% on lower body

Stages of Development

1. hyperemia: disappears 1 h after pressure removed
2. ischemia: follows 2-6 h of pressure
3. necrosis: follows >6 h of pressure
4. ulcer: necrotic area breaks down – N.B. skin is like tip of an iceberg

Classification (National Pressure Ulcer Advisory Panel 2014)

- Stage I: non-blanchable erythema present >1 h after pressure relief, skin intact
- Stage II: partial-thickness skin loss
- Stage III: full-thickness skin loss into subcutaneous tissue
- Stage IV: full-thickness skin loss into muscle, bone, tendon, or joint
 - if an eschar is present, must fully debride before staging possible
- Stage X: unstageable ulcer

Prevention

- good nursing care (clean dry skin, frequent repositioning), special beds or pressure relief surface, proper nutrition, activity, early identification of individuals at risk (e.g. immobility, incontinence, paraplegia, immunocompromised, DM, etc.)

Treatment

- depends on individual patient and condition
- treat underlying medical issues including nutrition
- continue with preventative measures (pressure relief, assess for pressure points e.g. wheelchairs; manage continence issues, divert contaminants e.g. urine and feces)
- wound debridement, moisture retentive or antimicrobial dressing, regular reassessment
- systemic antibiotics for infections
- assess for possible reconstruction

Complications

- cellulitis, osteomyelitis, sepsis, gangrene

Burns

Burn Injuries

Causal Conditions

- thermal (flame contact, scald)
- chemical
- radiation (UV, medical/therapeutic)
- electrical

Most Common Etiology

- children: scald burns
- adults: flame burns

Table 15. Skin Function and Burn Injury

Skin Function	Consequence of Burn Injury	Intervention Required
Thermoregulation	Prone to lose body heat	Must keep patient covered and warm
Control of fluid loss	Loss of large amounts of water and protein from the skin and other body tissues	Adequate fluid resuscitation is imperative
Mechanical barrier to bacterial invasion and immunological organ	High risk of infection	Antimicrobial dressings (systemic antibiotics if signs of specific infection present) Tetanus prophylaxis if not already administered

Pathophysiology of Burn Wounds

- amount of tissue destruction is based on temperature, time of exposure, and specific heat of the causative agent
- zone of hyperemia: vasodilation from inflammation; entirely viable, cells recover within 7 d; contributes to systemic consequences seen with major burns
- zone of stasis (edema): decreased perfusion; microvascular sludging and thrombosis of vessels results in progressive tissue necrosis → cellular death in 24-48 h without proper treatment
 - factors favouring cell survival: moist, aseptic environment, rich blood supply
 - zone where appropriate early intervention has most profound effect in minimizing injury
- zone of coagulation (ischemia): no blood flow to tissue → irreversible cell damage → cellular death/necrosis

Figure 19. Zones of thermal injury

Diagnosis and Prognosis

- burn size
 - % of TBSA burned: rule of 9s for 2° and 3° burns only (children <10 yr old use Lund-Browder chart)
 - for patchy burns, surface area covered by patient's palm (fingers closed) represents approximately 1% of TBSA
- age: more complications if <3 yr or >60 yr old
- depth: difficult to assess initially – history of etiologic agent and time of exposure helpful (see Table 16)
- location: face and neck, hands, feet, perineum are critical areas requiring special care of a burn unit (see *Indications for Transfer to Burn Centre, PL21*)
- inhalation injury: can severely compromise respiratory system, affect fluid requirement estimation (underestimate), mortality secondary to ARDS
- associated injuries (e.g. fractures)
- comorbid factors (e.g. concurrent disability, alcoholism, seizure disorders, chronic renal failure) can exacerbate extent of injury, other trauma

Prognosis best determined by burn size (TBSA), age of patient, presence/absence of inhalation injury

Circumferential burns can restrict respiratory excursion and/or blood flow to extremities and require escharotomy

TBSA does not include areas with 1° burns

Burns

Figure 20. Rule of 9s for TBSA

Burn Size And Survival Probability In Paediatric Patients In Modern Burn Care: A Prospective Observational Cohort Study

Lancet 2012 Mar 17;379(9820):1013-21

Study: Single-centre prospective observational cohort study using clinical data for paediatric patients with burns of at least 30% of their total body surface area (TBSA). Patients were stratified by burn size in 10% increments, ranging from 30% to 100% TBSA.

Results: 952 severely burned paediatric patients were admitted to the centre between 1998 and 2008. 123 (13%) patients died, 154 (16%) developed multiorgan failure, and 89 (9%) had sepsis. Burn size of 62% TBSA was a crucial threshold for mortality.

Conclusions: In a modern paediatric burn care setting, a burn size of roughly 60% TBSA is a crucial threshold for postburn morbidity and mortality. We recommend that paediatric patients with greater than 60% TBSA burns be immediately transferred to a specialised burn centre. Furthermore, patients should be treated with increased vigilance and improved therapies at the burn centre, in view of the increased risk of poor outcome associated with this burn size.

Figure 21. Lund-Browder diagram

Table 16. Burn Depth (1st, 2nd, 3rd degree)

Nomenclature	Traditional Nomenclature	Depth	Clinical Features
Erythema/Superficial	First degree	Epidermis	Painful, sensation intact, erythema, blanchable
Superficial-Partial Thickness	Second degree	Into superficial dermis	Painful, sensation intact, erythema, blisters with clear fluid, blanchable, hair follicles present
Deep-Partial Thickness	Second degree	Into deep (reticular) dermis	Insensate, difficult to distinguish from full thickness, does not blanch, some hair follicles still attached, softer than full thickness burn
Full Thickness	Third degree Fourth degree	Through epidermis and dermis Injury to underlying tissue structures (e.g. muscle, bone)	Insensate (nerve endings destroyed), hard leathery eschar that is black, grey, white, or cherry red in colour; hairs do not stay attached, may see thrombosed veins

Indications for Transfer to Burn Centre

American Burn Association Criteria

- patients with partial or full-thickness burns that involve the hands, feet, genitalia, face, eyes, ears, and/or major joints or perineum
- partial thickness burns $\geq 20\%$ TBSA in patients aged 10-50 yr old
- partial thickness burns $\geq 10\%$ TBSA in children aged ≤ 10 or adults aged ≥ 50 yr old
- full thickness burns $\geq 5\%$ TBSA in patients of all ages
- electrical burns, including lightning (internal injury underestimated by TBSA), and chemical burns
- inhalation injury (high risk of mortality and may lead to respiratory distress)
- burn injuries in patients with medical comorbidities, could complicate management and recovery
- any patient with simultaneous trauma plus burns should be stabilized for trauma first, then triaged appropriately to burn centre
- any patients with burn injury and who will require special emotional, social, and rehabilitation intervention
- children with burns in a hospital not equipped with pediatric care specialists

Acute Care of Burn Patients

- adhere to ATLS protocol
- resuscitation using Parkland formula to restore plasma volume and cardiac output. Parkland formula is a starting estimate and patients may require more volume. Other formulas exist, but the Parkland formula is predominately used in North America
 - $4 \text{ cc/kg} \times \% \text{TBSA}$ (greater than first degree) $\times \text{wt(kg)}$ (1/2 within first 8 h of sustaining burn, 1/2 in next 16 h)
- extra fluid administration required if
 - burn $> 80\%$ TBSA
 - 4° burns
 - associated traumatic injury
 - electrical burn
 - inhalation injury
 - delayed start of resuscitation
 - pediatric burns
- monitor resuscitation
 - urine output is best measure: maintain at $> 0.5 \text{ cc/kg/h}$ (adults) and 1.0 cc/kg/h in children < 12 yr
 - maintain a clear sensorium, HR $< 120/\text{min}$, MAP $> 70 \text{ mmHg}$
- burn-specific care
 - relieve respiratory distress: intubation and/or escharotomy
 - escharotomy in circumferential extremity burn, including digits
 - prevent and/or treat burn shock: 2 large bore IVs for fluid resuscitation
 - insert Foley catheter to monitor urine output
 - identify and treat immediate life-threatening conditions (e.g. inhalation injury, CO poisoning)
 - determine TBSA affected first, since depth is difficult to determine initially (easier to determine after 24 h)
- tetanus prophylaxis if needed
 - all patients with burns $> 10\%$ TBSA, or deeper than superficial-partial thickness, need 0.5 cc tetanus toxoid
 - also give 250 U of tetanus Ig if prior immunization is absent/unclear, or the last booster > 10 yr ago
- baseline laboratory studies (Hb, U/A, BUN, CXR, electrolytes, Cr, glucose, CK, ECG, cross-match if traumatic injury, ABG, carboxyhemoglobin)
- cleanse, debride, and treat the burn injury (antimicrobial dressings)
- early excision and grafting important for outcome

Respiratory Problems

- 3 major causes
 - burn eschar encircling chest
 - ♦ distress may be apparent immediately
 - ♦ perform escharotomy to relieve constriction
 - CO poisoning
 - ♦ may present immediately or later
 - ♦ treat with $100\% \text{ O}_2$ by facemask (decreases half-life of carboxyhemoglobin from 210 to 59 min) until carboxyHb $< 10\%$
 - smoke inhalation leading to pulmonary injury
 - ♦ chemical injury to alveolar basement membrane and pulmonary edema (insidious onset)
 - ♦ risk of pulmonary insufficiency (up to 48 h) and pulmonary edema (48-72 h)
 - ♦ watch for secondary bronchopneumonia (3-25 d) leading to progressive pulmonary insufficiency
 - ♦ intubate patient with any signs of inhalation injuries

Inhalation Injuries 101

- Indicators of inhalation injury
- Injury in a closed space
- Facial burn
- Singed nasal hair/eyebrows
- Soot around nares/oral cavity
- Hoarseness
- Conjunctivitis
- Tachypnea
- Carbon particles in sputum
- Elevated blood CO levels (i.e. brighter red)
- Suspected inhalation injury requires immediate intubation due to impending airway edema; failure to diagnose inhalation injury can result in airway swelling and obstruction, which, if untreated, can lead to death
- Neither CXR or ABG can be used to rule out inhalation injury
- Direct bronchoscopy now used for diagnosis
- Signs of CO poisoning (headache, confusion, coma, arrhythmias)

Burn Wound Healing

Table 17. Burn Shock Resuscitation (Parkland Formula)

Hour 0-24	4 cc RL/kg/% TBSA with 1/2 of total in first 8 h from time of injury and 1/2 of total in next 16 h from time of injury
Hour 24-30	0.35-0.5 cc plasma/kg/%TBSA
>Hour 30	D5W at rate to maintain normal serum sodium

*Do not forget to add maintenance fluid to resuscitation

Table 18. Burn Wound Healing

Depth	Healing
First degree	No scarring; complete healing
Second degree (Superficial partial)	Spontaneously re-epithelialize in 7-14 d from retained epidermal structures ± residual skin discolouration Hypertrophic scarring uncommon; grafting rarely required
Deep second degree (Deep partial)	Re-epithelialize in 14-35 d from retained epidermal structures Hypertrophic scarring frequent Grafting recommended to expedite healing
Third degree (Full thickness)	Re-epithelialize from the wound edge Grafting/flap necessary to replace dermal integrity, limit hypertrophic scarring
Fourth degree	Often results in amputations If not requiring amputation, needs flap for coverage after debridement (do not re-epithelialize, cannot graft)

Treatment

- 3 stages
 1. assessment: depth determined
 2. management: specific to depth of burn and associated injuries
 3. rehabilitation
- first degree
 - treatment aimed at comfort
 - topical creams (pain control, keep skin moist) ± aloe
 - oral NSAIDs (pain control)
- superficial second degree/partial thickness
 - daily dressing changes with topical antimicrobials (such as polysporin); leave blisters intact unless circulation impaired or over joint and inhibiting motion
- deep second degree/deep partial thickness and third degree/full thickness
 - prevent infection and sepsis (significant complication and cause of death in patients with burns)
 - ♦ most common organisms: *S. aureus*, *P. aeruginosa*, and *C. albicans*
 - day 1-3 (rare): Gram-positive
 - day 3-5: Gram-negative (*Proteus*, *Klebsiella*)
 - ♦ topical antimicrobials: treat colonized wounds (from skin flora, gut flora, or caregiver)
 - remove dead tissue
 - ♦ surgically debride necrotic tissue, excise to viable (bleeding) tissue

Table 19. Antimicrobial Dressings for Burns

Antibiotic	Pain with Application	Penetration	Adverse Effects
Silver nitrate (0.5% solution)	None	Minimal	May cause methemoglobinemia, stains (black), leaches sodium from wounds
Nanocrystalline silver-coated dressing (Acticoat®)	None or transient	Medium, does not penetrate eschar	May stain, producing a pseudoeschar or facial discolouration (argyria-like symptoms); raised liver enzymes
Silver sulfadiazine (cream) (Flamazine®, Silvadene®)	Minimal	Medium, penetrates eschar poorly Most commonly used	Slowed healing, leukopenia, mild inhibition of epithelialization
(Sulfamylon®)	Moderate	Well, penetrates eschar	Mild inhibition of epithelialization, may cause metabolic acidosis with wide application

Risk Factors for Infection of Burn Wounds

Patient Related

- Extent >30% TBSA
- Depth: full-thickness and deep partial-thickness
- Patient age (higher risk with very young and very old)
- Comorbidities
- Wound dryness
- Wound temperature
- Secondary impairment of blood flow to wound
- Acidosis

Microbial Factors

- Density >10⁶ organisms per gram of tissue
- Motility
- Virulence and metabolic products (endotoxin, exotoxin, permeability factors, other factors)
- Antimicrobial resistance

- early excision and grafting is the mainstay of treatment for deep/full thickness burns
- initial dressing should decrease bacterial proliferation
- prevention of wound contractures: pressure dressings, joint splints, early physiotherapy

Other Considerations in Burn Management

Figure 22. Systemic effects of severe burns

- nutrition
 - hypermetabolism: TBSA >40% have BMR 2-2.5x predicted
 - consider nutritional supplementation e.g. calories, vitamin C, vitamin A, Ca^{2+} , Zn^{2+} , Fe^{2+}
- immunosuppression and sepsis
 - must keep bacterial count <105 bacteria/g of tissue (blood culture may not be positive)
 - signs of sepsis: sudden onset of hyper/hypothermia, unexpected CHF or pulmonary edema, development of ARDS, ileus >48 h post-burn, mental status changes, azotemia, thrombocytopenia, hypofibrinogenemia, hyper/hypoglycemia (especially if burn >40% TBSA)
- GI bleed may occur with burns >40% TBSA (usually subclinical)
 - treatment: tube feeding or NPO if there is a GI bleed, antacids, H_2 blockers (preventative)
- renal failure secondary to under resuscitation, drugs, myoglobin, etc.
- progressive pulmonary insufficiency
 - can occur after: smoke inhalation, pneumonia, cardiac decompensation, sepsis
- wound contracture and hypertrophic scarring (outcomes optimized with timely wound closure, splinting, pressure garments) and physiotherapy

Special Considerations

CHEMICAL

- major categories: acid burns, alkaline burns, phosphorous burns, chemical injection injuries
- common agents: cement, hydrofluoric acid, phenol, tar
- mechanism of injury: chemical solutions coagulate tissue protein leading to necrosis
 - acids → coagulation necrosis
 - alkalines → saponification followed by liquefactive necrosis
- severity related to: type of chemical (alkali worse than acid), temperature, volume, concentration, contact time, site affected, mechanism of chemical action, degree of tissue penetration
- burns are deeper than they initially appear and may progress with time

Treatment (General)

- ABCs, monitoring
- remove contaminated clothing and brush off any dry powders before irrigation
- irrigation with water for 1-2 h under low pressure (contraindicated in heavy metal burns, such as sodium, potassium, magnesium, and lithium; in these cases, soak in mineral oil instead)
- inspect eyes, if affected: wash with saline and refer to ophthalmology
- inspect nails, hair, and webspaces
- correct metabolic abnormalities and tetanus prophylaxis if necessary
- contact poison control line if necessary
- local wound care 12 h after initial dilution (debridement)
- wound closure same as for thermal burn
- beware of underestimated fluid resuscitation, renal, liver, and pulmonary damage

Special Burns and Treatments

Acid Burn	Water irrigation, followed by dilute solution of sodium bicarbonate
Hydrofluoric Acid	Water irrigation; clip fingernails to avoid acid trapping; topical calcium gel ± subcutaneous injection of calcium gluconate ± 10% calcium gluconate IV depending on amount of exposure and pain
Sulfuric Acid	Treat with soap/lime prior to irrigation, as direct water exposure produces extreme heat
Tar	Remove with repeated application of petroleum-based antibiotic ointments (e.g. Polysporin®)

ELECTRICAL BURNS

- depth of burn depends on voltage and resistance of the tissue (injury more severe in tissues with high resistance)
- often presents as small punctate burns on skin, with extensive deep tissue damage which requires debridement
- electrical burns require ongoing monitoring, as latent injuries can occur
- watch for system-specific damages and abnormalities
 - abdominal: intraperitoneal damage
 - bone: fractures and dislocations especially of the spine and shoulder
 - cardiopulmonary: anoxia, ventricular fibrillation, arrhythmias
 - muscle: myoglobinuria indicates significant muscle damage → compartment syndrome
 - neurological: seizures and spinal cord damage
 - ophthalmology: cataract formation (late complication)
 - renal: ATN resulting from toxic levels of myoglobin and hemoglobin
 - vascular: vessel thrombosis → tissue necrosis (increased Cr, K⁺, and acidity), decrease in RBC (beware of hemorrhages/delayed vessel rupture)

Tissue Resistance to Electrical Current
 nerve < vessel/blood < muscle < skin < tendon < fat < bone

Treatment

- ABCs, primary and secondary survey, treat associated injuries
- beware of cardiac arrhythmias (continue cardiac monitoring)
- monitor: hemochromogenuria, compartment syndrome, urine output
- wound management: topical agent with good penetrating ability (silver sulfadiazine or mafenide acetate)
- debride nonviable tissue early and repeat prn (every 48 h) to prevent sepsis
- amputations frequently required

FROSTBITE

- see [Emergency Medicine, ER46](#)

Hand

Traumatic Hand

Table 20. Key Features of the History and Physical Exam of the Injured Hand

HISTORY		
Key Questions	Age	Tetanus status
	Hand dominance	Diabetes
	Occupation	Smoking status
	Time and place of accident	Last oral intake
	Mechanism of injury	
	Initial treatment received	
PHYSICAL EXAM		
Observation	Position of finger	Abnormal cascade (fingers normally slightly flexed and point towards scaphoid), scissoring
	Deformity	Bony protrusions or specific deformities (e.g. mallet, boutonnière, and swan neck deformity)
	Bruising or swelling	May indicate underlying skeletal injury
	Sweating pattern (usually felt more so than from observation)	May indicate denervation
	Anatomical structures beneath	If open laceration, need to explore within wound (under sterile conditions)
	Structure	Examination
Vascular Status	Radial and ulnar arteries	Palpate pulses Allen's test
	Digital arteries	Assess capillary refill (<2-3 s) Doppler ultrasound
	Temperature and skin turgor	For each test, need to compare both sides
Sensory (see Figure 4)	Median nerve	Volar radial tip of index finger
	Ulnar nerve	Volar ulnar tip of little finger
	Radial nerve	Dorsal web space of the thumb
	Digital nerves	2 point discrimination on both the radial and ulnar side of the DIPJ creases (static or moving 2 point discrimination)

Compartment Syndrome
 Watch out for these signs with a closed or open injury: tense, painful extremity (worse on passive stretch), paresthesia/paralysis, pallor, distal pulselessness (often late in process), and contracture (irreversible ischemia)
 Intracompartmental pressures can be measured (normal pressure = up to 12 mmHg, abnormal is 30-40 mmHg), but a clinical diagnosis is an indication for an emergent fasciotomy; if untreated, end result is ischemic contracture of the extremity (Volkmann's contracture)

Approach to Hand Lacerations

TIN AX
 Tetanus prophylaxis
 Irrigate with NS (copious irrigation and debridement in a timely manner)
 NPO (NPO if you are considering replanting or an urgent OR, otherwise most operations are done as elective procedures)
 Antibiotic prophylaxis (controversial – most require no ABX, mainly needed for animal bites and dirty wounds)
 X-rays

Allen's Test: You need to exsanguinate the hand by having the patient open and close the hand. Then, while patient's hand is firmly closed, occlude both radial and ulnar arteries. Once fist is open, release either artery and assess collateral flow

Table 20. Key Features of the History and Physical Exam of the Injured Hand (continued)

	Structure	Examination
Motor Function	Median nerve	Flex DIP of index finger (to test the anterior interosseus nerve (AIN) branch) Touch the tip of the index finger to the thumb trying to break through ("OK sign") (to test the AIN branch) Thumb to ceiling with palm up (to test the recurrent motor branch) Thumb to tip of 5th digit (to test the recurrent motor branch)
	Ulnar nerve	Extrinsic muscles: flex DIP of little finger Intrinsic muscles: abduct index finger ("Peace sign") or patient able to hold piece of paper between adducted thumb and index finger and resist pulling ("Froment's sign")
	Radial nerve	Extrinsic muscles: extend thumb ("thumb's up") and wrist
Range of Motion	Tendons, bones, joints, nerves	Assess active and passive range of motion of wrist: extension/flexion/ulnar/radial deviation; finger abduction/adduction/flexion/extension, thumb flexion/extension/abduction/adduction/opposition
Tendons	FDP	Stabilize PIP in extension, ask patient to flex fingers (at DIP)
	FDS	Stabilize non-exam fingers in extension (neutralizes FDP) and ask patient to flex examination finger (at PIP)
Palpation	Bones	Focal tenderness or abnormal alignment
	Joints	Instability may indicate ligamentous injury or dislocation

High pressure injection injury, e.g. pain gun, is deceptively benign-looking (small pinpoint hole on finger pad) often with few clinical signs. Intense pain and tenderness, along the course the foreign material travelled, is present a few hours after the injury. Definitive treatment is exposure and removal of foreign material

General Management of Hand Injuries

Nerves

- **test the nerve function BEFORE putting in local anesthesia**
- primary repair for a clean injury within 7 d and without concurrent major injuries; secondary repair if >7 d (may require nerve graft)
- epineurial repair of all digital nerves with minimal tension
- post-operative: dress wound, elevate hand, and immobilize
- Tinel's sign (cutaneous percussion over the repaired nerve) produces paresthesias and defines level of nerve regeneration
 - Wallerian degeneration occurs in the first 2 wk, which is why there is no Tinel's sign until after this time period
 - a peripheral nerve regenerates at 1 mm/d
 - paresthesias felt at area of percussion because regrowth of myelin (Schwann cells) is slower than axonal regrowth → percussion on exposed free-end of axon generates paresthesia

Vessels

- often associated with nerve injury (anatomical proximity)
- control bleeding with direct pressure and hand elevation
- if digit devascularized, optimal repair within 6 h
- close skin, then dress, immobilize, and splint hand with fingertips visible
- monitor colour, capillary refill, skin turgor, fingertip temperature post-revascularization

Tendons

- most tendon lacerations require primary repair
- many extensors are repaired in the emergency room, flexors are repaired in the operating room within 2 wk
- avoid excessive immobilization after repair (specific protocols for flexors to minimize stiffness and facilitate rehabilitation)

Bones

- see *Fractures and Dislocations, PL27*

Nailbed

- subungual hematomas >50% of the nail surface area need to be drained (trephination), done under a digital block by puncturing nail plate
- if suspecting greater severity of injury (e.g. distal phalanx displaced fracture, laceration of nail bed), remove nail plate to examine underlying nailbed under digital block anesthesia
- irrigate wound and nail thoroughly
- suture repair of nailbed with chromic suture
- replace cleaned nail, which acts as a splint for any underlying distal phalangeal fracture and prevents adhesion formation between nail fold and nailbed

Hand Exam

- Never blindly clamp a bleeding vessel as nerves are often found in close association with vessels
- Never explore any volar hand wound in the ER
- Arterial bleeding from a volar digital laceration is likely associated with a nerve laceration (nerves in digits are superficial to arteries)

Hand Infections

Principles

- trauma is most common cause
- 5 cardinal signs: rubor (red), calor (hot), tumour (swollen), dolor (painful), and functio laesa (loss of function)
- 90% caused by Gram-positive organisms
- most common organisms (in order) – *S. aureus*, *S. viridans*, Group A *Streptococcus*, *S. epidermidis*, and *Bacteroides melaninogenicus* (MRSA is becoming more common)

TYPES OF INFECTIONS

Deep Space Infections

- abscess formation in deep spaces of the hand, most commonly thenar or mid-palm space
- uncommon, there are 9 spaces in the hand

Felon

- **definition:** abscess in the pulp of a fingertip or thumb that occurs following a puncture wound into the pad of the digit; may be associated with osteomyelitis (akin to compartment syndrome and can lead to skin necrosis)
- **treatment:** elevation, warm soaks, cloxacillin 500 mg PO q6h (if in early stage); if obvious abscess or pressure on the overlying skin or failure to resolve with conservative measures, then needs I&D, take cultures/gram stain and adjust antibiotics to culture results

Flexor Tendon Sheath Infection

- *Staphylococcus* > *Streptococcus* > Gram-negative rods
- **definition:** abscess within the flexor tendon sheath (flexor tenosynovitis), commonly caused by a penetrating injury and can lead to tendon necrosis and rupture if not treated; it is often suppurative; however, there can be very little pus early on
- **clinical features:** Kanavel's 4 cardinal signs
 1. point tenderness along flexor tendon sheath
 2. severe pain on passive extension of digit
 3. fusiform swelling of entire digit
 4. flexed posture (increased comfort)
- **treatment**
 - OR I&D, copious irrigation and debridement, IV antibiotics, resting hand splint until infection resolves, aggressive hand therapy after

Herpetic Whitlow

- HSV-1, HSV-2
- **definition:** painful vesicle(s) around fingertip or thumb
 - often found in medical/dental personnel and children
- **clinical features:** can be associated with fever, malaise and lymphadenopathy, prodromal phase
 - patient is infectious until lesion has completely healed
- **treatment:** diagnosed clinically, if in doubt confirm with viral culture/PCR or Tzanck smear, usually self-limited, consider oral acyclovir in severe cases; I&D is contraindicated

Paronychia

- acute = *Staphylococcus*; chronic = *Candida*
- **definition:** infection (granulation tissue) of soft tissue around fingernail (within the paronychium and/or beneath eponychial fold)
- **etiology**
 - acute paronychia: a "hangnail", artificial nails, and nail biting
 - chronic paronychia: prolonged exposure to moisture
- **treatment**
 - acute paronychia: warm compresses and oral antibiotics if caught early; if abscess present, drainage with blade (avoid hitting nail bed) and oral/IV antibiotics; if abscess extends to below nail plate, nail plate removal may be required
 - chronic paronychia: anti-fungals, eponychial marsupialization, nail plate removal may be required

Amputations

Hand or Finger

- emergency management: injured patient and amputated part require attention
 - **patient:** x-rays (stump and amputated part), NPO, clean wound and irrigate with NS, dress stump with nonadherent dressing, cover with dry sterile dressing, tetanus and antibiotic prophylaxis (cephalosporin/erythromycin)
 - **amputated part:** x-rays, gently irrigate with RL, wrap amputated part in a NS/RL soaked sterile gauze and place inside waterproof plastic bag, place in a container, then place container on ice
- **indications for replantation**
 - **age:** children often better results than adults
 - **level of injury:** thumb and multiple digit amputations are higher priority; multiple level amputation is a contraindication to replant
 - **nature of injury:** clean cut injuries have greater success; avulsion and crush injuries are relative contraindications to replant
- if replant contraindicated, manage stump with revision amputation
 - involves debriding stump of wound, trimming back the bone and nerve endings, and gently closing the skin
 - commonly done in the ER under digital block

Tendons

Common Extensor Tendon Deformities

Table 21. Extensor Tendon Deformities

Injury	Definition	Zone (see Figure 23)	Etiology/Clinical Features	Treatment
Mallet Finger	DIP flexed with loss of active extension	1	There are bony and non-bony mallets Bony: Fracture of distal phalanx distal to tendon insertion Non-bony: Forced flexion of the extended DIP leading to extensor tendon rupture at DIP (e.g. sudden blow to tip of the finger)	Splint DIP in extension for 6 wk, followed by 2 wk of night splinting; if inadequate improvement after 6 wk, check splinting routine and recommend 4 more wk of continuous splinting
Boutonnière Deformity	PIP flexed, DIP hyperextended	3	Injury or disease affecting the extensor tendon insertion into the dorsal base of the middle phalanx Associated with RA or trauma (laceration, volar dislocation, acute forceful flexion of PIP)	Splint PIP in extension and allow active DIP motion
Swan Neck Deformity	PIP hyperextended, DIP flexed	1,3	Trauma (PIP volar plate injury) Associated with RA and old, untreated mallet deformity Splint to prevent PIP hyperextension or DIP flexion	Corrective procedures involve tendon rebalancing or arthrodesis/arthroplasty

Figure 23. (A) Mallet finger deformity (B) Boutonnière deformity (C) Swan neck deformity

De Quervain's Tenosynovitis

- **definition:** tenosynovitis is inflammation of the tendon and/or its sheath. Most common is De Quervain's tenosynovitis (inflammation of the extensor tendons in the 1st dorsal compartment [APL and EPB])
- **clinical features**
 - +ve Finkelstein's test (pain over the radial styloid induced by making fist, with thumb in palm, and ulnar deviation of wrist)
 - pain localized to the 1st extensor compartment
 - tenderness and crepitation over radial styloid may be present
 - differentiate from CMC joint arthritis (CMC joint arthritis will have a positive grind test, whereby crepitus and pain are elicited by axial pressure to the thumb)

Figure 24. Zone of extensor tendon injury (odd numbered zones fall over a joint)

- **treatment**
 - mild: NSAIDs, splinting and steroid injection into the tendon sheath (successful in over 60% of cases)
 - severe: surgery to open 1st dorsal compartment and release stenotic tendon sheaths of APL and EPB

Ganglion Cyst

- **definition**
 - fluid-filled synovial lining that protrudes between carpal bones or from a tendon sheath; most commonly carpal in origin
 - most common soft tissue tumour of hand and wrist (60% of masses)
- **clinical features**
 - most commonly on the dorsal wrist overlying the scapholunate ligament, followed by the volar surface of the wrist overlying the radioscaphoid or scaphotrapezoid joints
 - 3 times more common in women than in men
 - more common in younger individuals (2nd to 4th decades)
 - can be large or small – may drain internally so size may wax and wane
 - often non-tender, although tenderness increased when cyst is smaller (from increased pressure within smaller cyst sac)
- **treatment**
 - conservative treatment: do nothing
 - aspiration (recurrence rate 30-60%)
 - steroid injection if painful (done in combination with aspiration, as results alone are no better than aspiration)
 - consider operative excision of cyst and stalk (recurrence rate 5.9% for dorsal wrist ganglion, 30% for volar)

Common Flexor Tendon Deformities

- flexor tendon zones (important for prognosis of tendon lacerations)
- “no-man’s land” (zone 2) (see Figure 24)
 - between distal palmar crease and mid-middle phalanx
 - zone where superficialis and profundus lie ensheathed together
 - recovery of glide very difficult after injury

Stenosing Tenosynovitis (trigger finger/thumb)

- **definition:** inflammation and thickening of tendon or tendon sheath/pulley (most commonly at A-1 pulley near MCP), preventing smooth gliding of tendon through the sheath/pulley and resulting in locking of thumb or finger in flexion/extension
- **etiology:** idiopathic or associated with RA, DM, hypothyroidism, gout, and pregnancy
- **clinical features**
 - ring finger is most commonly affected, then long finger and thumb
 - patient complains of catching, snapping, or locking of affected finger
 - tenderness to palpation/nodule at palmar aspect of MCP over A-1 pulley
 - women are 4 times more likely to be affected than men
- **non-surgical treatment**
 - NSAIDs
 - steroid injection; injections less likely to be successful in patients >60 yr, or symptoms greater than 6 mo
 - splint
- **surgical treatment**
 - indicated if no relief of symptoms or minimal relief with steroids
 - incise A-1 flexor pulley to permit unrestricted, full active finger motion

Figure 25. Zones of the flexor tendons

A-2 and A-4 pulleys are most important for function; prevent bowstringing of tendons

Fractures and Dislocations

- for fracture principles, see [Orthopedics, OR4](#)

FRACTURES

- about 90% of hand fractures are stable in flexion (splint to prevent extension)
- **position of safety**
 - wrist extension 0-30°
 - MCP flexion 70-90°
 - IP full extension
 - this is done if you want to immobilize a fracture but are not sure whether there are other injuries
- stiffness secondary to immobilization is the most important complication; Tx = early motion

Distal Phalanx Fractures

- most commonly fractured bone in the hand
- usual mechanism is crush injury, and thus accompanied by soft tissue injury
- subungual hematoma is common and must be decompressed, especially if there is involvement of >50% of the nail surface area

- injury involving >50% of the nail surface area often suggests a nail bed laceration, in which the patient would benefit from nail plate removal and nailbed repair surgery
- treatment consists of **3 wk** of digital splinting (immobilize the DIP with a STAX splint); if intra-articular fracture displaced >30%, then percutaneous pinning (K-wires) and splint

Proximal and Middle Phalanx Fractures

- check for: rotation, scissoring (overlap of fingers on making a fist), shortening of digit
- non-displaced or minimally displaced: closed reduction (if extra-articular), buddy tape to neighbouring stable digit, elevate hand, motion in guarded fashion early, splinted for **2-3 wk**
- displaced, non-reducible, not stable with closed reduction, or rotational or scissoring deformity: percutaneous pinning (K-wires) or ORIF, and splint

Metacarpal Fractures

- generally accept varying degrees of deviation before reduction required: up to 10° (D2), 20° (D3), 30° (D4), or 40° (D5)
- **Boxer's fracture:** acute angulation of the neck of the 5th metacarpal into palm
 - mechanism: blow on the distal-dorsal aspect of closed fist
 - loss of prominence of metacarpal head, volar displacement of head
 - up to 30-40° angulation may be acceptable
 - if greater angulation, closed reduction should be considered to decrease the angle
 - if stable, ulnar gutter splint for **4-6 wk**
- **Bennett's fracture:** two-piece fracture/dislocation of the base of the thumb metacarpal, usually intra-articular
 - unstable fracture
 - APL pulls MC shaft proximally and radially, causing adduction of thumb
 - treat with percutaneous pinning or ORIF, followed by thumb spica x 6 wk
- **Rolando fracture:** T- or Y-shaped fracture of the base of the thumb metacarpal
 - treated like a Bennett's fracture

DISLOCATIONS

- must be reduced as soon as possible
- dislocation vs. subluxation
 - dislocation: severe injury where articular surfaces of a joint are no longer in contact with one another
 - subluxation: articular surfaces of a joint are partially out of place (i.e. "partial dislocation" – often unstable and requires reduction)

PIP and DIP Dislocations (PIP more common than DIP)

- usually dorsal dislocation (commonly from hyperextension)
- if closed dislocation: closed reduction and splinting in position of function for 1 wk or buddy taping, and early mobilization (prolonged immobilization causes stiffness)
- open injuries are treated with wound care, irrigation, and debridement, followed by closed or open reduction and antibiotics

MCP Dislocations (relatively rare)

- dorsal dislocations much more common than volar dislocations
- dorsal dislocation of proximal phalanx on metacarpal head; most commonly index finger (hyperextension)
- two types of dorsal dislocation
 - simple (reducible with manipulation): treat with closed reduction and splinting for 2-4 wk at 60-70° MCP flexion
 - complex (irreducible - most commonly due to volar plate blocking the reduction): treat with open reduction

Ulnar Collateral Ligament (UCL) Injury

- forced abduction of thumb (e.g. ski pole injury)
- **Skier's thumb:** acute UCL injury – if stable, treated with splint x 6-8 wk; if unstable, patient may have Stener lesion
- **Gamekeeper's thumb:** chronic UCL injury, often requires open repair and tendon graft for stabilization
- **Stener Lesion:** the distal portion of the UCL can detach and flip superficial to the adductor aponeurosis and will not appropriately heal – requires open repair
- **evaluation:** radially deviate thumb MCP joint in full extension and at 30° flexion and compare with non-injured hand. UCL rupture is presumed if injured side deviates more than 30° in full extension or more than 15° in flexion

Dupuytren's Disease

Definition

- proliferative disorder of the palmar fascia, forming nodules (usually painless), fibrous cords, and flexion contractures at the MCP and interphalangeal joints
- flexor tendons not involved
- Dupuytren's diathesis: male sex, early age of onset, strong family history (autosomal dominant inheritance), involvement of multiple digits, bilateral involvement, and involvement of sites other than palmar aspect of hand, including the plantar fascia (Ledderhose's) and the penis (Peyronie's) – (see [Urology, U30](#))

Epidemiology

- unusual in patients from African and Asian countries, high incidence in northern Europeans, men > women, often presents in 5th-7th decade of life; associated with but not caused by alcohol use, smoking, and DM

Clinical Features

- nodules, cords, and contractures of MCP, PIP, DIP
- order of digit involvement (most common to least common): ring > little > long > thumb > index
- risk of recurrence

Treatment

- palmar pit or nodule: no surgery (steroid injections for pain)
- palpable band/cord with no limitation of extension (i.e. no contracture) of either MCP or PIP: no surgery
- MCP contracture >30 degrees or PIP contracture of any degree: needle aponeurotomy, collagenase injection, or surgical fasciectomy
- contractures impeding function and/or hygiene: needle aponeurotomy, collagenase injection, or surgical fasciectomy
- MCP joints have better outcomes than PIP joints post-treatment (achievement of near full extension, lower risk of recurrence)

Figure 26. Dupuytren's disease

Carpal Tunnel Syndrome

Definition

- median nerve compression at the level of the flexor retinaculum/transverse carpal ligament

Etiology

- median nerve entrapment at wrist
- primary cause is idiopathic
- secondary causes: space occupying lesions (tumours, hypertrophic synovial tissue, fracture callus, and osteophytes), metabolic and physiological (pregnancy, hypothyroidism, acromegaly, and RA); job/hobby related repetitive trauma, especially forced wrist flexion

Epidemiology

- female:male = 4:1, **most common entrapment neuropathy**

Clinical Features

- classically, patient awakened at night with numb/painful hand, relieved by shaking/dangling/rubbing
- on exam, sensory loss in median nerve distribution (see [Figure 4](#)), but thenar eminence sensory loss is spared (palmar cutaneous branch given off prior to carpal tunnel)
- decreased light touch and 2-point discrimination at DIP radial and ulnar creases; discriminative touch often lost first
- advanced cases: thenar wasting/weakness due to involvement of the motor branch of the nerve
- ± Tinel's sign (tingling sensation on percussion of nerve)
- ± Phalen's sign (wrist flexion induces symptoms)

Investigations

- clinical diagnosis
- NCV and EMG studies may be used to objectively confirm the diagnosis

Treatment

- avoid repetitive wrist and hand motion, wrist splints at night and when repetitive wrist motion required
- conservative: night-time splinting to keep wrist in neutral position
- medical: NSAIDs, local corticosteroids injection (relief from local corticosteroid injections is also diagnostic)
- surgical decompression: transverse carpal ligament incision to decompress median nerve
- indications for surgery: persistent signs and symptoms of median nerve compression not relieved by conservative management

Brachial Plexus

Etiology

- common causes of brachial plexus injury: complication of childbirth and trauma
- other causes of injury: compression from tumours, ectopic ribs

Common Palsies

Table 22. Named Neonatal Palsies of the Brachial Plexus

Palsy	Location of Injury	Mechanism of Injury	Features
Duchenne-Erb Palsy	Upper brachial plexus (C5-C6)	Head/shoulder distraction (e.g. motorcycle)	"Waiter's tip deformity" (shoulder internal rotation, elbow extension and pronation, wrist flexion)
Klumpke's Palsy	Lower brachial plexus (C7-T1)	Traction on abducted arm	"Claw hand" May include Horner's syndrome

Differential Diagnosis of Adult-Acquired Brachial Plexus Palsies

- trauma (blunt, penetrating)
- thoracic outlet syndrome
 - associated with large cervical rib, anomalous first rib, strenuous arm work, neck muscle hypertrophy
 - neurogenic: compression of brachial plexus, resulting in upper limb paresthesia, pain, and weakness
 - vascular: compression/thrombosis of subclavian artery/vein, resulting in pain; pallor and Raynaud's if arterial; swelling and cyanosis if venous
- tumour
 - schwannoma: well-defined margins enable total resection
 - neurofibromas: associated with neurofibromatosis type I
 - other: e.g. Pancoast syndrome (apical lung tumour)
- neuropathy (compressive, post-irradiation, viral, diabetic, idiopathic)

Investigations

- EMG
- MRI: gold standard for identifying soft tissue masses and nerve roots
- CT myelogram: controversial, although some people think that it is better than MRI for identification of nerve root avulsion
- closed injuries: if avulsion suspected, then CT myelogram or MRI initially; otherwise, EMG/NCS 6-12 weeks post-injury to assess healing progress
- open injuries: OR for exploration within a few days post-injury (once patient stable)

Management

Table 23. Management of Brachial Plexus Injuries

Type	Treatment
Closed Injuries	
Concussive/compressive	Usually improves (unless expanding mass, e.g. hematoma)
Traction/stretch	If no continued insult, follow for 3-4 mo for improvement
Obstetric palsy	Surgery if no significant improvement and/or residual paresis at 6 mo of age
Open Injuries	
Sharp or vascular injury	Explore immediately in OR

Craniofacial Injuries

- low velocity vs. high velocity injuries determine degree of damage
- fractures cause bruising, swelling, and tenderness → loss of function
- management: most can wait ~5 d for swelling to decrease before ORIF required

Approach to Facial Injuries

- ATLS protocol
- inspect, palpate, clinical assessment for injury to underlying structures (e.g. facial nerve, bony injuries, septal hematoma, ocular involvement, etc.)
- tetanus prophylaxis
- radiological evaluation: CT scan with fine cuts through the orbit
- wound irrigation with NS/RL and remove foreign materials
- conservative debridement of detached or nonviable tissue
- repair at the time of presentation with 4-0 nylon sutures when the patient's general condition allows
- consider intracranial trauma; rule out skull fracture

Investigations

- CT (gold standard)
 - axial and coronal (specifically request 1.5 mm cuts): for fractures of upper and middle face, as well as mandible
 - indicated for significant head trauma, suspected facial fractures, pre-operative assessment
- panorex radiograph: shows entire upper and lower jaw; best for isolated mandible fracture, but patient must be able to sit; however, if high clinical suspicion and negative panorex, CT should be done

Treatment Goals

- consultation when indicated (dentistry, ophthalmology)
- re-establish normal occlusion if occlusion is an issue
- normal eye function (extraocular eye movements and vision)
- restore stability of face and appearance

Mandibular Fractures

- two points of injury since it is a ring structure (includes fractures and dislocations)
- commonly at sites of weakness (condylar neck, angle of mandible)

Etiology

- anterior force: bilateral fractures
- lateral force: ipsilateral subcondylar and contralateral angle or body fracture
- note: classified as open if fracture into tooth bearing area (alveolus)

Clinical Features

- pain, swelling, difficulty opening mouth ("trismus")
- malocclusion, asymmetry of dental arch
- damaged, loose, or lost teeth
- palpable "step" along mandible
- numbness in V3 distribution
- intra-oral lacerations or hematoma (sublingual)
- chin deviating toward side of a fractured condyle

Classification

Table 24. Mandibular Fracture Classifications by Anatomic Region

	Areas/Boundaries
Symphysis	Midline of the mandible; between the central incisors from the alveolar process through the inferior border of the mandible
Body	From the symphysis to the distal alveolar border of the third molar
Angle	Triangular region between the anterior border of the masseter and the posterosuperior insertion of the masseter distal to the third molar
Ramus	Part of the mandible that extends posteriosuperiorly into the condylar and coronoid processes
Condylar*	Area of condylar process of mandible
Subcondylar	Area below the condylar neck (i.e. sigmoid notch) of the mandible
Coronoid Process	Area of the coronoid process of mandible

*Most common mandibular fracture type

Patients with major facial injuries are at risk of developing upper airway obstruction (displaced blood clots, teeth, or fracture fragments; swelling of pharynx and larynx; loss of support of hyomandibular complex → retroposition of tongue); also at risk of ocular injury

Signs of Basal Skull Fracture

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF otorrhea/rhinorrhea

Figure 27. Mandibular fracture

Treatment

- maxillary and mandibular arch bars wired together (intramaxillary fixation) or ORIF ideally managed within 48 h as indicated by best current evidence
- antibiotics from initial presentation until at least 3 doses post-operatively; if late presentation, may consider treatment with antibiotics for an extended course

Maxillary Fractures

Table 25. Le Fort Classification

	Le Fort I	Le Fort II	Le Fort III
Alternative Name	Guérin fracture	Pyramidal fracture	Craniofacial dysjunction
Type of Fracture	Horizontal	Pyramidal	Transverse
Structures Involved	Piriform aperture Maxillary sinus Pterygoid plates	Nasal bones Medial orbital wall Maxilla Pterygoid plates	Nasofrontal suture Zygomaticofrontal suture Zygomatic arch Pterygoid plates
Anatomical Result	Maxilla divided into 2 segments	Maxillary teeth and midsection of the maxilla separated from upper face	Detach entire midfacial skeleton from cranial base

Nasal Fractures

Etiology

- lateral force → more common, good prognosis
- anterior force → can produce more serious injuries
- most common facial fracture

Clinical Features

- epistaxis/hemorrhage, deviation/flattening of nose, swelling, periorbital ecchymosis, tenderness over nasal dorsum, crepitus, septal hematoma, respiratory obstruction, subconjunctival hemorrhage

Treatment

- treated for airway or cosmetic issues
- always inspect for and drain septal hematoma as this is a cause of septal necrosis and perforation – completed in the ER with small incision in the septal mucosa followed by packing
- closed reduction with Asch or Walsham forceps under anesthesia, pack nostrils with petroleum or nonadhesive gauze packing, nasal splint for 7 d
- best reduction immediately (<6 h) or when swelling subsides (5-7 d)
- rhinoplasty may be necessary later for residual deformity (30%)

Zygomatic Fractures

Classification

1. fracture restricted to zygomatic arch
2. depressed fracture of zygomatic complex (zygoma)
3. unstable fracture of zygomatic complex (tetrapod fracture) – separations occur at maxilla, frontal bone, temporal bone, and orbital rim

Clinical Features

- 3 most common features (pathognomonic):
 - subconjunctival hemorrhage
 - periorbital ecchymosis (often associated with fractures of the orbital floor)
 - V2 numbness (infraorbital and superior dental nerves)
- flattening of malar prominence (view from above)
- pain over fractures on palpation
- palpable step deformity in bony orbital rim (especially inferiorly)
- ipsilateral epistaxis; trismus
- ophthalmologic evaluation if suspected globe injury

Treatment

- if undisplaced, stable, and no symptoms, then soft diet; no treatment necessary
- undisplaced zygomatic arch fractures can be elevated using Gillies approach (leverage on the anterior part of the zygomatic arch via a temporal incision) or Keane approach (elevation through upper buccal sulcus incision) only if arch is not comminuted
- if arch is comminuted, ORIF is required
- stabilization often unnecessary
- ORIF for displaced or unstable fractures of zygomatic complex

Figure 28. Le Fort fractures

Figure 29. Zygomatic fractures

Orbital Floor Fractures

- see [Ophthalmology, OP40](#)

Definition

- fracture of floor of orbit: may be a “pure blow-out fracture”, which has an intact orbital rim, or can be associated with other fractures (orbital rim fracture and/or zygoma)

Etiology

- blunt force to eyeball → sudden increase in intraorbital pressure (e.g. baseball or fist)

Clinical Features

- **check visual fields and visual acuity for injury to globe**
- periorbital edema and bruising, subconjunctival hemorrhage
- ptosis, exophthalmos, exorbitism, enophthalmos, or hypoglobus
- orbital rim step-offs with possible infraorbital nerve anesthesia
- vertical dystopia (abnormal displacement of the entire orbital cone in the vertical plane) – assessed by comparing the symmetry of the two pupils by a horizontal line running through the pupil of the unaffected eye
- orbital entrapment
 - clinical diagnosis that is a surgical emergency
 - diplopia with straight gaze: unable to look up or down (entrapment of inferior rectus), limited EOM
 - severe pain or nausea and vomiting with upward globe movement
 - requires urgent ophthalmology evaluation if there are associated visual acuity changes

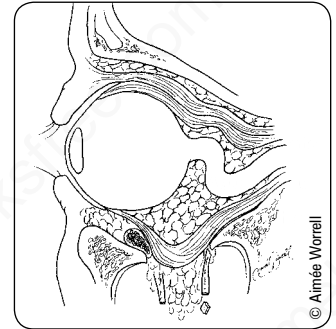

Figure 30. Blow-out fracture

Investigations

- CT (diagnostic): axial and coronal views – with fine cuts through orbit
- diagnostic maneuver for entrapment is forced duction test (pulling on inferior rectus muscle with forceps to ensure full ROM) under local anesthesia in the OR

Treatment

- surgical repair indicated if: entrapment (urgent), any size defect with enophthalmos (if patient is bothered by it) or persistent diplopia (>10 d)
- reconstruction of orbital floor with bone graft or alloplastic material
- after repair, assess for diplopia: may require additional surgery for strabismus

Complications

- persistent diplopia
- enophthalmos

Superior Orbital Fissure Syndrome

- fracture of SOF causing ptosis, proptosis, anesthesia in V1 distribution, and painful ophthalmoplegia (paralysis of CN III, IV, VI)
- uncommon complication seen in Le Fort II and III fractures (1/130)
- recovery time reported as 4.8-23 wk following operative reduction of fractures

Orbital Apex Syndrome

- fracture through optic canal with involvement of CN II at apex of orbit
- symptoms are the same as SOF syndrome plus vision loss
- treatment is urgent decompression of fracture in optic canal (posterior craniotomy for decompression) or steroids

Breast

Anatomy

Vascular Supply

Figure 31. Breast vasculature

Innervation

- innervated in a dermatomal pattern from branches of the thoracic intercostal nerves (T3-6)
 - medially innervated from anterior cutaneous branches of I-VI intercostal nerves
 - laterally innervated from lateral cutaneous nerve branches of II-VII intercostal nerves
- lateral and upper portions of the breast innervated by lower fibres of the cervical plexus (C3, C4)
- nipple areolar complex (NAC)
 - supplied by anterior and lateral cutaneous branches of intercostal nerve IV
 - additional innervation by cutaneous branches of intercostal nerves III and VI

Figure 32. Innervation of the breast

Breast Reduction

Indications

- symptomatic (general symptoms)
 - musculoskeletal pain (back, strap, neck), chronic headache, paresthesia in upper limb, rashes under the breast, breast discomfort and physical impairment
- breast reduction methods can be classified based on pedicle (i.e. blood supply to the nipple/areolar complex) and skin resection pattern (i.e. the resultant scar)

Figure 33. Types of pedicles

Table 26. Common Types of Pedicles

	Pedicle Description
Inferior Pedicle	Most commonly used technique; versatile use in small-large breast reduction Critiqued for boxy shape breast along with more extensive scarring (wise pattern skin resection) Recommended pedicle width 6-8 cm, 8-10 cm in large breasts
Superior Pedicle	Pedicle derived from the internal mammary perforator of the second intercostal space Pedicle must be thinned to permit inset
Medial Pedicle	Modified from horizontal bi-pedicle (Strombeck) techniques Blood supplied from internal mammary perforator from third intercostal and potentially fourth intercostal space
Superomedial Pedicle	Incorporate the descending artery from second intercostal space as medial pedicle base extended superolaterally to breast meridian

Table 27. Type of Skin Resections/Scar Options

	Indications	Description
Inverted T Pattern	Large breasts	Commonly used in association with inferior pedicle to remodel Large portion of skin removed in horizontal and vertical direction Skin integrity important to shape and hold breast parenchyma
	Breasts with poor quality skin that are challenging to remodel	
Vertical Pattern	Skin must be healthy and easy to remodel	Used in association with superior or medial pedicle
		Parenchyma needed to shape skin
		No horizontal scar Small to moderate reductions

Complications

- NAC necrosis
- sensory alteration of nipple (may vary with type of reduction pattern)
- unsatisfactory scarring, including hypertrophic or keloid scar
- wound healing complications (1-5% in healthy patients, higher in patients with elevated BMI)
- difficulty breastfeeding (potential issue in women of childbearing age)
- asymmetry
- hematoma
- wound infection

Figure 34. Inverted T shape

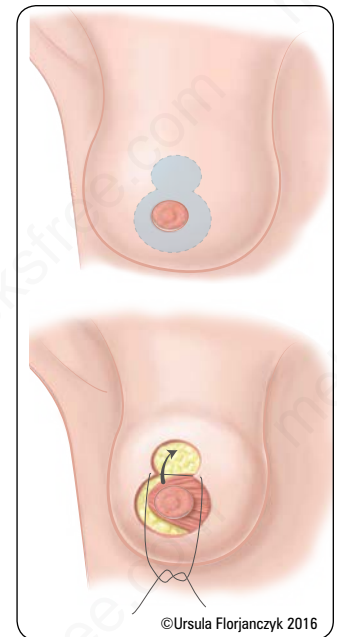

Figure 35. Vertical T shape

Mastopexy (Breast Lift)

Definition

- aesthetic procedure of the breast used to correct for breast ptosis by modifying the contour and size of the breast along with elevating the position of the nipple

Clinical Grading of Ptosis (Regnault Ptosis Grade Scale)

- minor ptosis (1st degree)
 - nipple at inframammary fold
- moderate ptosis (2nd degree)
 - nipple below inframammary fold, but above lower breast contour
- severe ptosis (3rd degree)
 - nipple below inframammary fold and at lower breast contour
- glandular ptosis
 - nipple above inframammary fold, but breast hangs below fold
- pseudoptosis
 - nipple above inframammary fold, but breast is hypoplastic and hangs below the fold

Table 28. Type of Skin Resection/Scar Options

	Indications	Description
Circumareolar Mastopexy	Nipple located 1-2.5 cm too low	Originally described as "donut mastopexy" Reduce areolar diameter while simultaneously raising nipple (<2 cm) Can correct nipple position asymmetry when used unilaterally Also increase infra-areolar skin display in ptotic breasts
Vertical Mastopexy	Grade I - III ptosis	Larger removal than circumareolar Raises nipple position and reduces circumareolar skin tension Larger angle between vertical limb and limb length increases with more lower pole skin
Inverted T Mastopexy	Most effective in grade II to III ptosis caused by skin excess attributed to large weight loss	Facilitate nipple elevation and parenchymal redistribution, fixation, and autoaugmentation techniques Large removal of skin in return for greater scar burden

- mastopexy can be performed through the same incisions as breast reductions

Breast Augmentation

Definition

- procedure designed to increase the size of the breast

Choice of Incision

- position of incision individualized since no single incision is best for all
- 3 commonly used types of incision: periareolar, inframammary crease, transaxillary

Type of Implant

- silicone or saline-filled
- subclassified into various styles of surface and shape

Location of Implant

- implants are commonly placed in the following positions:
 - submuscular positions
 - implant placed below pectoralis major muscle
 - most commonly in patients that do not have enough tissue to cover the implant
 - subglandular position
 - implant placed deep to glandular breast tissue but superficial to muscle
 - subfascial
 - implant placed below the fascia

Gynecomastia

Definition

- benign enlargement of the male breast due to proliferation of the glandular tissue

Clinical Classification

- gynecomastia can be further classified into:
 - idiopathic
 - physiologic
 - neonatal: circulating maternal estrogens via placenta
 - pubertal: relative excess of plasma estradiol versus testosterone
 - elderly: decrease circulating testosterone, peripheral aromatization of testosterone to estrogen
 - pathologic
 - endocrinopathies: excess estrogen, androgen deficiency, deficient production or action of testosterone
 - tumours
 - chronic disease: liver cirrhosis, renal
 - congenital/genetic: Klinefelter's syndrome, androgen resistance
 - pharmacologic
 - drugs that may interfere with estrogen-testosterone balance including:
 - hormones (estrogens, gonadotropins, exogenous steroids)
 - antiandrogens
 - androgen receptor antagonists (steroidal and non-steroidal)
 - androgen synthesis inhibitors (5 α -reductase inhibitors)
 - antigonadotropins (GnRH analogs, estrogens)
 - recreational drugs (marijuana, heroin, amphetamines)
 - antihypertensives (spironolactone)
 - massive weight gain
 - for physical exam, investigations, and medical management (see [Endocrinology, E47](#))

Surgical Options

- surgery is the accepted management for gynecomastia
- surgery addresses the three components (breast, fat, skin)
- often involves a combination of liposuction (to remove the fatty portion) and surgical excision through a small periareolar incision (to remove the glandular component)
- patients with significant skin excess may require skin excision as well

Breast Reconstruction

- reconstruction of the breast after cancer or trauma to recreate the breast which is similar to the contralateral breast
- reconstruction can be performed immediately (at the same time as mastectomy), or delayed (as a separate surgery months or years after initial surgery)
- there are alloplastic and autogenous methods of reconstruction, each with its advantages and disadvantages

Table 29. Timing of Immediate Reconstruction vs. Delayed Reconstruction

	Advantages	Disadvantages
Immediate Reconstruction	Generally best aesthetic outcome; may possibly preserve nipple if oncologically advisable Does not require creation of additional skin Tissues are not damaged from scarring Breast tissue retains size and shape of original breast	Skin viability assessment can be compromised Longer surgical time Less time for patient to consider surgical options
Delayed Reconstruction	More time for patients to discuss surgical options Best for patients unable or unwilling to have immediate reconstruction For patients who may be getting radiotherapy and undetermined post-surgery oncologic treatment Provides option of contralateral surgery with reconstruction, if required (i.e. contralateral cancer)	Loss of skin, volume, lateral border or breast, and natural landmarks, including IMF Resection of irradiated/scarred skin and associated wound healing complications, including risk of reconstructive failure Likely requires more stages for completion

Table 30. Alloplastic Reconstruction vs. Autogenous Reconstruction

		Advantages	Disadvantages
Alloplastic Reconstruction	One stage reconstruction with implant	Shorter surgery May give a more complete or final result	Size restriction in reconstruction Very few women meet criteria: grade 1 ptosis, small breast, skin-sparing mastectomy
	Two stage reconstruction with expander and implant	Less tension on mastectomy flaps compared to single-stage reconstruction with implants Ability to increase skin to create breast and avoid use of flap Some patient control over final outcome	Requires post-surgical procedures (requires patient to come to clinic for inflations) Size of reconstruction limited to size and vascularity of mastectomy flaps
Autogenous Reconstruction	Latissimus Dorsi Flap	Reliable pedicle Uses patient's own tissues Provides skin and muscles Possible to do muscle sparing procedure without flap compromise Provides good amount of skin and muscle for reconstruction Good option for delayed reconstruction, larger women, and to avoid complications of using abdominal wall	May also require implants for adequate volume
	TRAM (Transverse Rectus Abdominis Muscle) Flap Pedicled	Can be done as a fascial-sparing technique or as a free tissue transfer Provides a good amount of tissue for transfer in most women Provides a well-concealed scar	Second scar with second surgical site Volume depends on patient's donor site Pedicled TRAM: Weakness in rectus abdominis with higher bulge rates
	Free		Free TRAM: Similar complications to DIEPs Less muscle used, decreased risk of hernia or bulge
	DIEP (Deep Inferior Epigastric Perforator) Flap	Method spares rectus abdominis muscle and fascia and should theoretically preserve innervation and continuity of abdominal wall	Requires microsurgical training for meticulous dissection of flap and appropriate choice of perforator May not always be possible Abdominal scarring and second wound

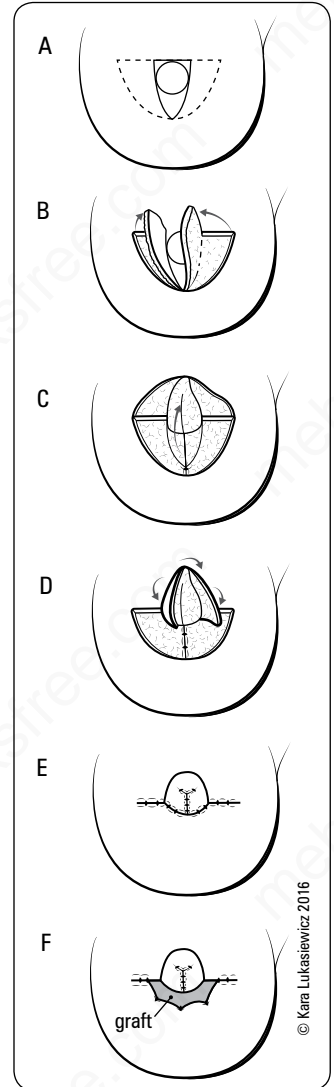

Figure 36. Skate flap
A-C, skate flap with primary closure of donor site. D-F, with skin graft

Nipple Areolar Complex Reconstruction

- nipple reconstruction is usually done as the final step when the patient is satisfied with breast mound creation
- reconstruction can be performed with local anesthetic since many women have decreased sensation in the mastectomy or breast flaps
- it can be done by either a flap, graft, or 3D tattoo

Table 31. Types of Nipple Reconstruction

Description	Advantages	Disadvantages
Skate flap Pedicle elevated above breast mound Lateral aspects of flap are wrapped around central aspect of flap Defect mainly closed by skin graft	Low complication rates	Donor site morbidity May have loss of projection over time Skin graft required
CV flap Utilizes C flap and two V flaps for nipple reconstruction Diameter of C flap becomes diameter of reconstructed nipple Width of V flaps dictate projection of reconstructed nipple CV closed with primary closure	No grafts required	Nipple size limited by flap dimensions May have loss of projection over time Tattooing required to match natural areola
Nipple graft Tissue commonly from contralateral nipple (nipple share) or labia Two methods for nipple graft: • Distal aspect of nipple removed transversely and defect closed with purse string suture • Nipple divided in half longitudinally, folded over, and closed with primary closure	Nipple share is an excellent option in patients with contralateral nipple projection > 1 cm	Donor site morbidity Decreased contralateral nipple sensation

Figure 37. CV flap

Table 32. Types of Areolar Reconstruction

	Description	Advantages	Disadvantages
Tattoo	Conducted 3-4 months after nipple reconstruction when most of the projection has stabilized	Can provide more accurate colour matching	May require touch-ups due to pigment fading over time with skin sloughing
Skin graft	Full thickness skin grafts, commonly from inner aspect of thigh or opposite areola	Provides texture and pigment resembling a natural areola	Donor site morbidity

* Tattoo and skin grafting can be used in conjunction

Aesthetic Surgery

Aesthetic Procedures

Table 33. Aesthetic Procedures

Location	Procedure	Description
Head/Neck	Hair transplants	Aesthetic improvement of hair growth patterns using hair follicle grafts or flaps
	Otoplasty	Surgical correction of protruding ears
	Forehead/Brow lift	Surgical procedure to lift the forehead and eyebrows
	Rhytidectomy	Surgical procedure to reduce wrinkling and sagging of the face and neck; "face lift"
	Blepharoplasty	Surgical procedure to shape or modify the appearance of eyelids by removing excess eyelid skin \pm fat pads
	Rhinoplasty	Surgical reconstruction of the nose \pm nasal airway
	Genioplasty	Chin augmentation via osteotomy or synthetic implant to improve contour
Skin	Chemical peel	Application of one or more exfoliating agents to the skin resulting in destruction of portions of the epidermis and/or dermis with subsequent tissue regeneration
	Dermabrasion	Skin resurfacing with a rapidly rotating abrasive tool; often used to reduce scars, irregular skin surfaces, and fine lines
	Laser resurfacing	Application of laser to the skin which ultimately results in collagen reconfiguration and subsequent skin shrinking and tightening; often used to reduce scars and wrinkles
	Injectable fillers	An injectable substance is used to decrease facial rhytids; can augment lips to create fuller appearance; substances include: collagen, fat, hyaluronic acid, and calcium hydroxyapatite (most common substances include hyaluronic acid and fat)
Other	Abdominoplasty	Removal of excess skin and repair of rectus muscle laxity (rectus diastasis); "tummy tuck"
	Calf augmentation	Augmentation of calf muscle with implants
	Liposuction	Surgical removal of adipose tissue for body contouring (not a weight loss procedure)

Pediatric Plastic Surgery

Craniofacial Anomalies

Table 34. Pediatric Craniofacial Anomalies

	Definition	Epidemiology	Clinical Features	Treatment
Cleft Lip	Failure of fusion of maxillary and medial nasal processes	1 in 1000 live births (1 in 800 Caucasians, increased in Asians, decreased in Blacks) M:F=2:1	Classified as incomplete/complete and uni/bilateral; 2/3 cases: unilateral, left-sided, male	Surgery (3 mo): Millard Tension-Randall, or Fisher (additional corrective surgeries usually required later on - especially for nasal deformity)
Cleft Palate	Failure of fusion of lateral palatine/median palatine processes and nasal septum	Isolated cleft palate: 0.5 per 1000 (no racial variation) F>M	Classified as incomplete/complete and uni/bilateral Isolated (common in females) or in conjunction with cleft lip (common in males)	Special bottles for feeding Speech pathologist Surgery (6-9 mo): Von Langenbeck or Furlow Z-Plasty ENT consult – often recurrent otitis media, requiring myringotomy tubes
Craniosynostosis	Premature fusion of ≥ 1 cranial sutures	1 in 2000 live newborns; M:F=52:48 Syndromes include: Crouzon's, Apert's, Saethre-Chotzen, Carpenter's, Pfeiffer's, Jackson-Weiss, and Boston-type syndromes	Primary (no known cause), or secondary (associated with a known cause or syndrome)	Multidisciplinary team (including neurosurgery, ENT, genetics, dentistry, pediatrics, SLP) The type, timing, and procedure are dependent on which sutures (lambdoid, sagittal, etc.) are involved Early surgery prevents secondary deformities \uparrow ICP is an indication for emergent surgery

Congenital Hand Anomalies

Table 35. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies

Classification	Example	Features	Treatment
Failure of Formation	Transverse absence (congenital amputation)	At any level (often below elbow/wrist)	Early prosthesis
	Longitudinal absence (phocomelia)	Absent humerus Thalidomide association	
	Radial deficiency (radial club hand)	Radial deviation Thumb hypoplasia M>F	Physiotherapy + splinting Soft tissue release if splinting fails Distraction osteogenesis (Ilizarov) ± wedge osteotomy Tendon transfer Pollicization
	Thumb hypoplasia	Degree ranges from small thumb with all components to complete absence	Depends on degree – may involve no treatment, webspace deepening, tendon transfer, or pollicization of index finger
	Ulnar club hand	Rare, compared to radial club hand Stable wrist	Splinting and soft tissue stretching therapies Soft tissue release (if above fails) Correction of angulation (Ilizarov distraction)
	Cleft hand	Autosomal dominant Often functionally normal (depending on degree)	First web space syndactyly release Osteotomy/tendon transfer of thumb (if hypoplastic)
Failure of Differentiation/ Separation	Syndactyly	Fusion of ≥2 digits 1/3,000 live births M:F=2:1 Classified as partial/complete Simple (skin only) vs. complex (osseous or cartilaginous bridges)	Surgical separation before 6-12 mo of age May require a skin graft to cover the fingers Usually good result
	Symbrachydactyly	Short fingers with short nails at fingertips	Digital separation Webspace deepening
	Camptodactyly	Congenital flexion contracture (usually at PIP, especially 5th digit)	Early splinting Volar release Arthroplasty (rarely)
	Clinodactyly	Radial or ulnar deviation Often middle phalanx	None (usually); if severe, osteotomy with grafting
Duplication	Polydactyly	Congenital duplication of digits May be radial (increased in Aboriginals and Asians) or central or ulnar (increased in Blacks)	Amputation of least functional digit Usually > 1 yr of age (when functional status can be assessed)
Overgrowth	Macroductyly	Rare	None (if mild) Soft tissue/bony reduction
Undergrowth	Brachydactyly	Short phalanges	Removal of nonfunctional stumps Osteotomies/tendon transfers Distraction osteogenesis Phalangeal/free toe transfer
	Symbrachydactyly	Short webbed fingers	As above + syndactyly release
	Brachysyndactyly		
Constriction Band Syndrome	i.e. amniotic (annular) band syndrome	Variety of presentations	Urgent release for acute, progressive edema distal to band in newborn Other reconstruction is case specific
Generalized Skeletal Abnormality	Achondroplasia, Marfan's, Madelung's	Variety of presentations	Treatment depends on etiology

Public Health Context

- see [Ethical, Legal, and Organizational Medicine, ELOM2 Overview of Canadian Healthcare System](#) for the organization of health care in Canada including the legal foundation and historical context

Definitions

- population health**
 - refers to the health of defined groups of people, their health determinants, trends in health, and health inequalities
 - influenced by: physical, biological, social, environmental, and economic factors; personal health behaviours; health care services
 - broader scope vs. public health, accounts for socio-economic, policy, historical issues
- public health**
 - "efforts organized by society to protect, promote, and restore the peoples' health" and prevent morbidity and mortality
 - refers to the practices, programs, policies, institutions, and disciplines required to achieve the desired state of population health
- epidemiology**
 - "study of the distribution [...] of determinants of disease, health-related states, and events in populations"
- public health and preventive medicine** (formerly called community medicine)
 - the postgraduate study of health and disease in the population or a specified community
 - 5 year Royal College specialty training
 - goal: to identify and address health problems and evaluate the extent to which health services and others address these issues

Sources: Shah, CP. Chapter 2 Measurement and Investigation. *Public Health and Preventive Medicine in Canada*, 5e. Toronto: Elsevier, 2003.
Shah, CP. Chapter 15 Community Health Services. *Public Health and Preventive Medicine in Canada*, 5e. Toronto: Elsevier, 2003.

Public Health Services in Canada

Mission: to promote and protect the health of Canadians through leadership, partnership, innovation, and action in public health" (Public Health Agency of Canada)

- local public health units and services within regional health authorities (in most provinces except Ontario, where local public health units are either autonomous or within local government) provide programs and activities for health protection, promotion, and disease prevention at local and regional levels
- catchment-area populations range widely (100s–1,000,000s), covering areas of 15 km² to 1.5 million km²
- the "core functions" of public health include six essential activities (The Organization of Health Services in Canada. AFMC Primer on Population Health, Accessed: March 25 2016)
 - health protection:** measures taken to address potential risks to health at the population level, including through regulation and advising government (e.g. safe water and food supply)
 - health surveillance:** monitoring and predicting health outcomes and determinants with systematic, longitudinal data collection
 - disease and injury prevention:** address infectious disease through preventive (e.g. vaccination, droplet protection) and control (e.g. quarantine) measures; reduce morbidity through lifestyle improvement
 - population health assessment:** studying and engaging with a community to understand their needs and produce better policies and services
 - health promotion:** advocate for improved health through broad community and government measures (e.g. policy, interventions, community organizing)
 - emergency preparedness and response:** developing protocols and infrastructure for natural (e.g. hurricane) and man-made (e.g. toxic waste spill) disasters

Sources: Shah, CP. Chapter 15 Community Health Services. *Public Health and Preventive Medicine in Canada*, 5e. Toronto: Elsevier, 2003.
The Association of Faculties of Medicine of Canada Public Health Educators' Network. The Organization of Health Services in Canada. AFMC Primer on Population Health.

Preparing for the LMCC

The AFMC Primer on Population Health is the core text for the LMCC and is available as an online resource on the AFMC website (<http://phprimer.afmc.ca>)

For the LMCC exam, it is recommended that you also read Chapter 15 in Shah CP. *Public Health and Preventive Medicine in Canada*, 5th ed. Toronto: Elsevier, 2003

Historical Perspective

Over the last century, Public Health has evolved through three main epidemiological phases:

- Infectious diseases: controlled in the more developed world but an issue in less developed countries (e.g. polio, malaria)
- Chronic diseases: chronic diseases and other noncommunicable conditions have increased morbidity and mortality (e.g. heart disease and cancer due to risk factors and/or exposures)
- Re-emerging infectious diseases: new or re-emergent infections emerge due to unfamiliar or new pathogens, inefficient or inappropriate antibiotic use, travel, and global warming (e.g. HIV, drug resistant TB and malaria)

CPHO of Canada

- Responsible for the PHAC and reports to the Minister of Health
- As the federal government's lead public health professional, provides advice to the Minister of Health and Government of Canada on health issues
- Collaborates with other governments, jurisdictions, agencies, organizations, and countries on health matters
- Communicates public health information to health professionals, stakeholders, and the public
- In an emergency, such as an outbreak or natural disaster, provides direction to PHAC staff, including medical professionals, scientists, and epidemiologists, as they plan and respond to the emergency

Legislation and Public Health in Canada

Table 1. Legislation and Public Health in Canada

Federal	Provincial	Municipal (Ontario)
<p>Health Canada</p> <ul style="list-style-type: none"> Provides health services to First Nations, Aboriginal peoples, the Canadian military, and veterans Approves new drugs and medical devices <p>Canadian Food Inspection Agency</p> <ul style="list-style-type: none"> Monitors food products Deals with animal-related infections Regulates food labeling <p>Public Health Agency of Canada (main Government of Canada agency responsible for public health)</p> <ul style="list-style-type: none"> An independent body created to strengthen public health capacity Focuses on preventing chronic diseases, preventing injuries, and responding to public health emergencies and infectious disease outbreaks Oversees immigration screening, protects Canadian borders (e.g. airport health inspection) Liaises with the World Health Organization (WHO) on global health issues 	<p>Legislation is in the form of Acts and Regulations</p> <p>Each province has its own Public Health Act or equivalent (e.g. the Health Protection and Promotion Act in Ontario)</p> <ul style="list-style-type: none"> Designates the creation of geographic areas for the provision of public health services Gives powers to the Chief Medical Officer of Health to control public health hazards Specifies infectious diseases to be reported to public health units by physicians, laboratories, and hospitals (see Appendix, PH24) Has the ability to mandate programs that address public health issues, environmental health, and chronic disease prevention 	<p>Local boards of health deliver programs mandated by provincial and municipal or regional legislation</p> <p>Boards of health are responsible for the delivery of most public health services, such as:</p> <ul style="list-style-type: none"> Infectious disease control, including the follow-up of reported diseases and management of outbreaks Inspection of food premises including those in hospitals, nursing homes, and restaurants Family health services including pre-conception, preschool, school-aged, and adult health programs Tobacco control legislation enforcement Assessment and management of local environmental health risks Collection and dissemination of local health status reports Public dental health services to children By-laws may be approved by municipal governments to facilitate public health issues

Medical Officer of Health (MOH) (Ontario)

- May be called "Medical Health Officer" (MHO) in other provinces
- Appointed to each public health unit by the board of health
- Held by a licensed physician with public health training
- Responsibilities include:
 - Collection and analysis of epidemiological data
 - Occupational and environmental health surveillance
 - Implementation of health programs, including:
 - Counselling
 - Family planning services
 - Parenting programs, prenatal courses
 - Preschool and school health services
 - Disease screening programs
 - Tobacco use prevention programs
 - Nutrition services to schools and seniors' centres
- The Medical Officer of Health can require an individual/premise/agency to take or refrain from any action due to a public health hazard

Determinants of Health

Concepts of Health

- wellness:** "state of dynamic physical, mental, social, and spiritual well-being that enables a person to achieve full potential and have an enjoyable life"
- disease:** "abnormal, medically-defined changes in the structure or function of the human body"
- illness:** "an individual's experience or subjective perception of a lack of physical or mental well-being and consequent inability to function normally in social roles"
- illness behaviour:** an individual's actions resulting from and responding to their illness, including their interactions or avoidance of the health care system
- sickness:** views the individual and their society hold towards a health condition, affecting their thoughts and actions
- impairment:** "any loss or abnormality of psychological, physiological, or anatomical structure or function"
- disability:** "any restriction or lack of ability to perform an activity within the range considered normal for a human being"
- handicap:** a disadvantage for an individual arising due to impairment or disability
 - "limits or prevents the fulfillment of an individual's normal role as determined by society and depends on age, sex, social, and cultural factors"
- health equity:** when all people have "the opportunity to attain their full health potential" and no one is "disadvantaged from achieving this potential because of their social position or other socially determined circumstance." Health inequities are systematic differences in the health of individuals/groups which are considered unjust
- health equality:** defined as where populations have equal or similar health status. Health inequalities are systematic differences in the health of groups that do not necessarily carry a moral judgement

Determinants of Health

- 1974: the Honourable Marc Lalonde, federal Minister of Health, publishes *A New Perspective on the Health of Canadians* which outlines four factors that determine health: "human biology, environment, lifestyle, and health care organizations." The idea of determinants of health has since been expanded and refined to include many additional factors

Sources: Shah, CP. Concepts, Determinants, and Promotion of Health. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003.

The Association of Faculties of Medicine of Canada Public Health Educators' Network. Concepts of Health and Illness. AFMC Primer on Population Health.

Definitions of Health

- First multidimensional definition of health, as defined by the WHO in 1948: "state of complete physical, mental and social well-being and not merely the absence of disease or infirmity"
- WHO updated the definition (socio-ecological definition) of health in 1986: "The ability to identify and to realize aspirations, to satisfy needs, and to change or cope with the environment. Health is therefore a resource for everyday life, not the objective of living. Health is a positive concept emphasizing social and personal resources, as well as physical capacities" (Ottawa Charter for Health Promotion)
- Other definitions of health have since been proposed that incorporate other dimensions of health (e.g. "Health is a social, economic, and political issue and above all a fundamental human right" – The People's Charter for Health)

Determinants of Health

- Income and social status
- Social support networks
- Education and literacy
- Employment and working conditions
- Social and work environments
- Physical environment
- Personal health practices and coping skills
- Healthy child development
- Biology, genetics, and epigenetics
- Health services
- Gender
- Culture

Source: Public Health Agency of Canada www.phac-aspc.gc.ca/ph-sp/determinants/determinants-eng.php

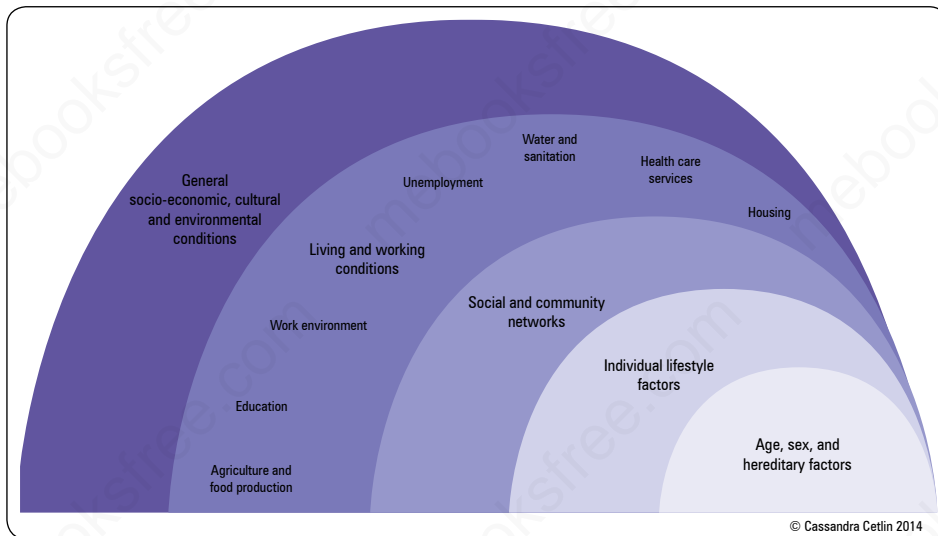

Figure 1. Population health model

Adapted from Dahlgren G, Whitehead M. European strategies for tackling social inequities in health: Leveling up Part 2. World Health Organization, 2006.

- **cultural safety:** “interactions with people from different cultures that treat them respectfully in a manner that acknowledges relevant differences but does not create a sense of discrimination”
- **cultural sensitivity:** “being aware of (and understanding) the characteristic values and perceptions of your own culture and the way in which this may shape your approach to patients from other cultures”

Sources: The Association of Faculties of Medicine of Canada Public Health Educators’ Network. Glossary. AFMC Primer on Population Health.

Social Determinants: Indigenous People’s Health in Canada

- Colonization: subjugation of Indigenous peoples by the Europeans, leading to the loss of lands, cultural practices, and self-government
- Residential schools: placement of children from Indigenous groups in church-run, government-funded schools for the purpose of assimilation, resulting in loss of identity, alienation, and abuse, with long-lasting consequences of higher rates of addictions, abusive relationships, and suicide
- Treaties and land claims: inadequate services for those living on reserves leading to poverty and poor quality infrastructure, reflected in disproportionate burden of infectious diseases (e.g. pertussis, Chlamydia, hepatitis, shigellosis)
- Traditional approach to healing: restoring balance in the four realms of spiritual, emotional, mental and physical health of a person acting as an individual, as well as a member of a family, community and nation
- Ideas represented by medicine wheel of First Nations peoples, the Learning Blanket of Inuit peoples, and the Metis tree model of Holistic Lifelong Learning
- Contrast to Western medicine focus of treating illness, leading to challenges for practitioners of Western medicine to meet Aboriginal patients’ needs
- National Aboriginal Health Organization (NAHO) offers 8 guidelines on practicing culturally safe health care for Aboriginal patients including need to allow Aboriginal patients access to ceremony, song, and prayer; the need for information and for family support; guidelines for the appropriate disposal of body parts and for handling death

New Immigrants to Canada

- Mandatory medical exams on entry to Canada by a designated medical practitioner:
- Complete medical examination for all persons of all ages
- Chest x-ray and report for persons 11 yr of age and over
- Urinalysis for persons 5 yr of age and over
- Syphilis serology for persons 15 yr of age and over
- HIV testing for applicants 15 yr of age and over, as well as for those children who have received blood or blood products, have a known HIV-positive mother, or have an identified risk. An ELISA HIV screening test should be done for HIV 1 and HIV 2
- Serum creatinine if the applicant has hypertension (resting blood pressure greater than 140/90 mmHg), a history of treated hypertension, DM, autoimmune disorder, persistent proteinuria, or kidney disorder

Citizenship and Immigration Canada Handbook <http://www.cic.gc.ca/english/resources/publications/dmp-handbook/>

Vulnerable Populations

Table 2. Health Determinants of Vulnerable Populations

Definition	Psychosocial/ Socioeconomic	Physical	Environment	Individual Behaviour	Population-Specific Interventions
Aboriginal Peoples	Four specific groups: First Nations Status Indians (registered under the <i>Indian Act</i>), non-Status Indians, Métis, and Inuit	Low income Family violence Low education status Unemployment Homelessness Longer length of disability	Crowded housing Inefficient ventilation Environmental toxins (botulism) TB declining but prevalence higher than rest of population	Smoking Substance misuse Excessive gambling Poor nutrition Sedentary lifestyle High BMI Higher risk of suicide	Mental health awareness Aboriginal-specific DM initiatives Substance abuse treatment programs
Isolated Seniors	Individuals >65 yr	Elder abuse Lack of emotional support Isolation	Low hazard tolerance Institutionalization Mobility issues	Inactivity Polypharmacy Medical comorbidities	Aging in place of choice Falls and injury prevention Mental health promotion Preventing abuse and neglect
Children in Poverty	Based on Low Income Cut Offs (LICO) LICO is an income threshold below which a family will likely devote a larger share of its income on the necessities of food, shelter and clothing than the average family	Low income Family dysfunction Lack of educational opportunities	Housing availability Unsafe housing Lack of recreational space	Poor supervision Food insecurity High risk behaviours	Improvements in family income most significant Early childhood education

Table 2. Health Determinants of Vulnerable Populations (continued)

Definition	Psychosocial/ Socioeconomic	Physical	Environment	Individual Behaviour	Population-Specific Interventions
People with Disabilities	Includes impairments, activity limitations, and participation restrictions	Low income Low education status Discrimination Stigma	Institutionalization Barriers to access Transportation challenges	Substance misuse Poor nutrition Inactivity Dependency for ADLs	Transportation support Multidisciplinary care Unique support for individuals with specific disabilities (e.g. Trisomy 21)
New Immigrants	Person born outside of Canada who has been granted the right to live in Canada permanently by immigration authorities	Access to community services Cultural perspectives (including reliance on alternative health practices)	Exposure to diseases and conditions in country of origin (e.g. smoke from wood fires, incidence of TB, etc.)	Employment, ESL Healthy Newcomer Effect (health worsens over time to match that of the general population) Cultural or religious expectations	Women's health Mental health Infectious diseases (syphilis blood test, CXR, HIV) Dental and vision screening Vaccinations Cancer screening
Homeless Persons	An individual who lacks permanent housing	Low income Food insecurity Mental illness	Exposure to temperature extremes Infections such as West Nile Virus	Substance misuse Violence	Safe housing Addictions support Mental health
Refugee Health	Forced to flee country of origin because of a well-founded fear of persecution and given protection by the Government of Canada Refugee claimant: Arrive in Canada and ask to be considered refugee	Post-traumatic stress disorders Depression Adjustment problems Partial health coverage via Interim Federal Health Program	Diseases and conditions in country of origin (e.g. malaria, TB, onchocerciasis, etc.) Direct and indirect effects of war	Employment ESL Longstanding prior lack of access to health care (chronically neglected problems) Cultural or religious expectations	Vaccinations Women's health Mental health Infectious diseases Dental and vision screening Political advocacy

Note: this chart delineates the major challenges faced by each group, but the issues listed are not unique to each population
Sources: Shah, CP. The Health of Vulnerable Groups. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003.

Disease Prevention

Natural History of Disease

- course of a disease from onset to resolution
 - pathological onset
 - presymptomatic stage: from onset to first appearance of symptoms/signs
 - clinical manifestation of disease: may regress spontaneously, be subject to remissions and relapses, or progress to death

Disease Prevention Strategies

- measures aimed at preventing the occurrence, interrupting through early detection and treatment, or slowing the progression of disease/mitigating the sequelae

Table 3. Levels of Disease Prevention

Level of Prevention	Goal	Sample Strategies
Primary	Protect health and prevent disease onset	Immunization programs (e.g. measles, diphtheria, pertussis, tetanus, polio, see Pediatrics, P4) Smoking Cessation Seatbelt use
Secondary	Early detection of disease to minimize morbidity and mortality	Mammography Routine Pap smears
Tertiary	Treatment and rehabilitation of disease to prevent progression, permanent disability, and future disease	DM monitoring with HbA1c, eye exams, foot exams Medication

Basic Concepts in Prevention, Surveillance, and Health Promotion. AFMC Primer on Population Health (<http://phprimer.afmc.ca/Part1-TheoryThinkingAboutHealthChapter4BasicConceptsInPreventionSurveillanceAndHealthPromotion/TheStagesofPrevention>)

Passive prevention, measures that operate without the person's active involvement (e.g. airbags in cars) are more effective than active prevention, measures that a person must do on their own (e.g. wearing a seatbelt)

Example of Primary Prevention Gardasil Vaccine and Its Efficacy in the Prevention of Cervical Cancer

Gardasil® is a quadrivalent HPV vaccine covering strains 6,11,16,18. The efficacy of Gardasil® was studied in 4 randomized, double-blind, placebo controlled trials on females between 16 and 26 yr of age and was found to prevent nearly 100% of precancerous cervical changes for up to 4 yr after vaccination

Ottawa Charter for Health Promotion (1986)

- Health promotion: the process of enabling people to increase control over and improve their health
- The charter states that governments and health care providers should be involved in a health promotion process that includes:
 - Building healthy public policy
 - Creating supportive environments
 - Strengthening community action
 - Developing personal skills
 - Re-orienting health services

Screening (Secondary Prevention)

- “presumptive identification of unrecognized disease or defect by the application of tests, examinations, or other procedures which can be applied rapidly”
- **types of screening**
 - mass screening: screening all members of a population for a disease (e.g. phenylketonuria (PKU) and hypothyroidism in all newborns)
 - selective screening: screening of targeted subgroups of the population at risk for a disease (e.g. mammography in women >50 yr old)
 - multiphasic screening: the use of many measurements and investigations to look for many disease entities (e.g. periodic health exam)
- **bias in screening**
 - lead-time: false improvement in survival time caused by changing the starting point of measurement, as opposed to real improvements measured from the original starting point (e.g. due to better therapy)
 - lead-time bias: overestimation of survival time ‘from diagnosis’ when the estimate is made from the time of screening, instead of the later time when the disease would have been diagnosed without screening
 - length-time bias: overestimation of the survival time due to screening at one time point including more stable cases than aggressive cases of disease, who may have shorter survival times

Figure 2. Lead-time bias

Table 4. Ideal Criteria for Screening Tests

Disease	Test	Health Care System
Causes significant suffering and/or death Natural history must be understood Must have an asymptomatic stage that can be detected by a test Early detection and intervention must result in improved outcomes Incidence is not too high or too low	High specificity and sensitivity Safe, rapid, easy, relatively inexpensive Acceptable to providers and to population	Adequate capacity for reporting, follow-up, and treatment of positive screens Cost effective Sustainable program Clear policy guidelines

Health Promotion Strategies

Table 5. Disease Prevention vs. Health Promotion Approach

Disease Prevention	Health Promotion
Health = absence of disease	Health = positive and multidimensional concept
Medical model (passive role)	Participatory model of health
Aimed mainly at high-risk groups in the population	Aimed at the population in its total environment
One-shot strategy, aimed at a specific pathology	Diverse and complementary strategies aimed at a network of issues/determinants
Directive and persuasive strategies enforced in target groups	Facilitating and enabling approaches by incentives offered to the population
Focused mostly on individuals and groups of subjects	Focused on a person’s health status and environment
Led by professional groups from health disciplines	Led by non-professional organizations, civic groups, local, municipal, regional, and national governments

Source: Shah CP. Public Health and Preventive Medicine in Canada, 5th ed. Toronto: Elsevier, 2003

Healthy Public Policy

- characterized by an explicit concern for health and equity in all areas of policy and by an accountability for health impact
- main aim: to create a supportive environment to enable people to lead healthy lives, thereby making healthy choices easier for citizens
- government sectors must take into account health as an essential factor when formulating policy and should be accountable for the health consequences of their policy decisions
- methods
 - fiscal: imposing additional costs (e.g. taxes on tobacco and alcohol)
 - legislative: implementing legal deterrents (e.g. smoking bans, legal alcohol drinking age)
 - social: improving health beyond providing universally funded health care (e.g. providing affordable housing)

Source: International Conference on Health Promotion, Adelaide, South Australia (1998)

Example of Harm Reduction Strategies: Tobacco Harm Reduction and The Case for the Electronic Cigarette

Harm Reduct J 2013 Oct 4;10:19.

Conventional smoking cessation strategies such as nicotine replacement therapy, bupropion or varenicline pharmacotherapy have demonstrated low uptake and poor overall efficacy despite garnering some increase in quit rates. Alternative sources of nicotine, such as the electronic cigarette, deliver nicotine vapor without combustion products responsible for most of the damaging effects experienced by traditional smoking methods, and without the emission of traditional cigarette toxins. Therefore, the electronic cigarette represents a harm reduction strategy with health risks similar to smokeless tobacco, with approximately 1% of the mortality risk associated with traditional cigarette smoking. Electronic cigarettes have also been associated with other benefits, such as improved exercise tolerance, decreased cough symptoms, decreased odorous breath, relief from withdrawal and craving symptoms of traditional cigarettes, relatively lower expenses and increased likelihood of smoking abstinence.

Behaviour Change

- health education serves to:
 - increase knowledge and skills
 - encourage positive behaviour changes and discourage unhealthy choices
- health education is an important component of eliciting behaviour change
- behaviour is a result of three factors
 - predisposing factors: knowledge, attitude, beliefs, values, intentions
 - enabling factors: skills, supports
 - reinforcing factors: health care professionals and the social context of family and community
- Health Belief Model (1975)**
 - "behaviours undertaken by individuals in order to remain healthy [...] are a function of a set of interacting beliefs"
 - beliefs include: (i) individual's perception of their susceptibility to a disease, (ii) severity of the disease, (iii) efficacy of proposed change/action, (iv) benefits and costs of health-related actions
 - beliefs are modified by socio-demographic and psychosocial variables
 - individuals must be in a state of readiness
 - behaviour can be stimulated by cues to action, which are triggers that can encourage preventive health decisions and actions (e.g. physician recommendation, public advertising)
- Stages of Change Model**
 - provides a framework in which the Health Belief Model is applied to facilitating behaviour change (e.g. quitting smoking)

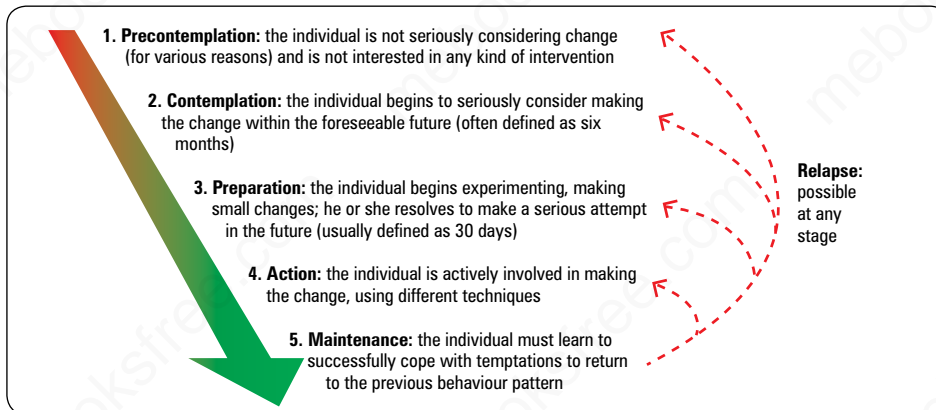

Figure 3. Stages of change model

Source: Prochaska JO, DiClemente CC, and Norcross JC. In Search of How People Change. Applications to Addictive Behaviours. Am Psychol 1992;47:1102-1114

Risk Reduction Strategies

- risk reduction:** lower the risk to health without eliminating it (e.g. avoiding sun to lower risk of skin cancer)
- harm reduction:** tolerance of some degree of risk behaviour, while aiming to minimize the adverse outcomes associated with these behaviours (e.g. needle exchange programs)

Source: Shah, CP. Concepts, Determinants, and Promotion of Health. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003

Example of Harm Reduction Strategy – Evaluation of a Pilot Medically Supervised Safer Injecting Facility

CMAJ 2006;175:1399-1404

Purposes: To evaluate the outcomes of a supervised safer injecting facility facilitating pre-obtaining illicit drugs under supervision of medical staff, conducted over a 3 year period.

Methods: Illicit drug users (IDUs) of the Vancouver area were allowed to inject previously obtained illicit drugs under the supervision of nurses and physicians. IDUs were offered addiction counselling and supports for appropriate community resources.

Results: A random sample of 670 IDUs was recruited and monitored from Dec 2003-July 2004. Characteristics of IDUs who used the safe injecting facility included age <30 yr, history of public drug use, homelessness, daily heroin and/or cocaine injection, and recent history of overdose. Mean measures of public order problems were taken 6 wk before and 12 wk after initiation of the safer injection facility. It was found that the mean number of IDUs injecting daily in public, along with the mean number of publically discarded syringes were reduced by approximately half.

Conclusion: Overall it has been found that the safer injecting facility in Vancouver has been successful in attracting IDUs at increased risk of HIV, overdose, and public injection of substances. This has resulted in lower incidences of public drug use, publicly discarded syringes and sharing of needles. Other studies associated with this one have demonstrated that there has been no increase in the drug dealing, drug related crimes, or rates of new IDUs in the area surrounding the safer injecting facility.

Incidence and Prevalence

of new cases in a

$$\text{Incidence} = \frac{\text{time interval}}{\text{persons at risk in time interval}}$$
 (measures the rate of new infections)

of existing cases

$$\text{Prevalence} = \frac{\text{at a point in time}}{\text{persons at risk at that time}}$$
 (measures the frequency of disease at a point in time)

e.g. For Canada in 2011:

HIV incidence rate is 9.5 per 100,000 people
 HIV prevalence is 213 per 100,000 people

Measurements of Health and Disease in a Population

MEASURES OF DISEASE OCCURRENCE

Incidence Rate

- number of new cases in a population per unit of person-time

Prevalence

- total number of cases in a population over a defined period of time
- two forms of prevalence
 - point prevalence:** assessed at one point in time
 - period prevalence:** as above, but all cases over defined time window (including 'incident' ones) are included:
- depends on **incidence rate** and disease duration from onset to termination (cure or death)
- favours the inclusion of chronic over acute cases and may underestimate disease burden if those with short disease duration are missed
- prevalence studies are cross-sectional and provide weak evidence for causal inferences
- prevalence figures are useful for determining the extent of a disease and can aid in the planning of facilities and services

Top 5 Causes of Mortality in Canada, 2012, by Sex

- Female**
- Cancer
 - Heart disease
 - Stroke
 - COPD/chronic lower respiratory disease
 - Alzheimer's

- Male**
- Cancer
 - Heart disease
 - Accidents
 - Stroke
 - COPD/chronic lower respiratory disease

Source: Statistics Canada. CANSIM, 2012. Table 102-0561 and 102-0562 and catalogue no.84-215-X

Age Standardized Rate

- adjustment of the crude rate of a health-related event using a “standard” population
- standard population is one with a known number of persons in each age and sex group
- standardization prevents bias which could be made by comparing crude rates from two dissimilar populations (e.g. crude death rates over a number of decades are not comparable as the population age distribution has changed with time)

MEASURES OF MORTALITY

Life Expectancy

- “the expected number of years to be lived by a newborn based on age-specific mortality rates at a selected time”
- usually qualified by country, gender, and age

Crude Death Rate

- mortality from all causes of death per 1,000 in the population

Infant Mortality Rate (IMR)

- number of deaths among children >1 yr of age reported during a given time period divided by the number of live births reported during the same time period and expressed per 1000 live births per year

Maternal Mortality Rate (MMR)

- “number of deaths of women during pregnancy and due to puerperal causes [...] per 1000 live births in the same year”

MEASURES OF DISEASE BURDEN

Potential Years of Life Lost (PYLL)

- calculated for a population using the difference between the actual age at death and a standard/expected age at death
- increased weighting of mortality at a younger age

Disability Adjusted Life Year (DALY)

- life expectancy weighted by amount of disability experienced
- both premature death and time spent with disability accounted for; these disabilities can be physical or mental

Quality Adjusted Life Year (QALY)

- years of life weighted by utility (similar to quality of life), ranging from 0-1 assigned to a year of life based on perceived quality of life; a yr in “perfect” health is considered equal to 1 QALY, the value of a year in ill health would be lowered based on the burden of disease
- it is possible to have “states worse than death” for example QALY <0 for extremely serious conditions

For additional rate calculations see *Outbreak of Infectious Diseases*, PH19

Consult the Public Health Agency of Canada for examples and latest statistics

<http://www.phac-aspc.gc.ca/cphorsphc-respcacsp/2008/fr-rc/cphorsphc-respcacsp06b-eng.php>

Sources: Shah, CP. Health Indicators and Data Sources. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003

The Association of Faculties of Medicine of Canada Public Health Educators' Network. Methods: Measuring Health. AFMC Primer on Population Health.

Principles of Standardization

- When comparing a health measure (e.g. mortality) between two populations (or the same population at different time points) that differ in characteristics known to influence that outcome (e.g. age), standardization is used to control for the effect of that factor
- Standardization is either direct or indirect
- Indirect standardization is expressed as standardized outcome ratio. For example, Standardized Mortality Ratio (SMR) is calculated using age specific rates for a reference population, as well as age structure and total cases for a sample/known population. (e.g. an SMR of 100 signifies that deaths are at the expected level, a SMR of 110 indicates a death rate 10% higher than expected)
- Direct standardization is expressed as a rate. (i.e. using age specific rates in a known/sample population against a standard population)

Epidemiology

Population

- a defined collection of individuals/regions/institutions/etc (e.g. individuals defined by geographic region, sex, age)

Sample

- a selection of individuals from a population
- types
 - random: all members are equally likely to be selected
 - systematic: an algorithm is used to select a subset
 - stratified: population is divided into subgroups that are each sampled
 - cluster: grouped in space/time to reduce costs
 - convenience: non-random inclusion, usually volunteers

Sample Size

- sample size contributes to the statistical precision of the observed estimate
- increasing the sample size decreases the probability of type I and type II errors
- increasing sample size does not reduce bias/confounding

Bias

- systematic error causing results to differ from correct values/inferences
- can occur at any point in study execution (e.g. collection, analysis, interpretation, publication, or review of data)
 - **sampling bias:** occurs with the selection of a sample that does not truly represent the population
 - ♦ sampling procedures should be chosen to prevent or minimize bias
 - **measurement bias:** systematic error arising from inaccurate measurements of subjects
 - **recall bias:** bias in individuals' responses when reporting on past exposures/events
 - ♦ e.g. individuals with disease may be more likely to incorrectly recall/believe they were exposed to a possible risk factor than those who are free of disease

Confounder

- a variable that is related to both the exposure and outcome but is not a mediator in the exposure-outcome relationship
 - distorts the estimated effect of an exposure if not accounted for in the study design/analysis (e.g. late maternal age could be a confounder in an investigation of birth order >4 and risk of developing Trisomy 21)
 - randomization, stratification, matching, and regression modelling can help minimize confounder effects
- Source: The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health.

SPIN: use a **SP**ecific test to rule **IN** a hypothesis. Note that specific tests have very few false positives. If you get a positive test, it is likely a true positive
SNOUT: use a **SEN**sitive test to rule **OUT** a hypothesis. Note that sensitive tests have very few false negatives. If you get a negative test, it is likely a true negative

Interpreting Test Results

TP = True positive TN = True negative FP = False positive FN = False negative

		Disease	
		Present	Negative
Test Result	Positive	TP	FP
	Negative	FN	TN

Sensitivity = $\frac{TP}{TP+FN}$
 Specificity = $\frac{TN}{TN+FP}$

Likelihood Ratio (LR)

- Likelihood that a given test result would be expected in a patient with disease compared with the likelihood that the same result would be expected in a patient without disease
- LR+ indicates how much the probability of disease increases if the test is positive
- LR- indicates how much the probability of disease decreases if the test is negative

$LR+ = \frac{\text{Sensitivity}}{1 - \text{Specificity}} = \frac{[TP/(TP+FN)]}{[FP/(TN+FP)]}$ $LR- = \frac{1 - \text{Sensitivity}}{\text{Specificity}} = \frac{[FN/(TP+FN)]}{[TN/(TN+FP)]}$

Positive Predictive Value (PPV)

- Proportion of people with a positive test who have the disease

$PPV = \frac{TP}{TP + FP}$

Negative Predictive Value (NPV)

- Proportion of people with a negative test who are free of disease

$NPV = \frac{TN}{TN + FN}$

		Advanced Neoplasia	
		Present	Negative
Test Result	Positive	68	147
	Negative	216	2234
Total		284	2381

Sensitivity = $\frac{68}{284} = 23.9\%$
 Specificity = $\frac{2234}{2381} = 93.8\%$

$LR+ = \frac{0.239}{1 - 0.938} = 3.85$

$LR- = \frac{1 - 0.239}{0.938} = 0.81$

$PPV = \frac{68}{(68 + 147)} = 31.6\%$

$NPV = \frac{2234}{(2234 + 216)} = 91.2\%$

Figure 5. Interpreting test results: Practical example using FOBT testing in advanced colon cancer

Source: Numbers from Collins J, Lieberman D, Durbin T, et al. Accuracy of screening for fecal occult blood on a single stool sample obtained by digital rectal examination: a comparison with recommended sampling practice. *Ann Intern Med* 2005;142:81-85

Sensitivity

- proportion of people with disease who have a positive test

Specificity

- proportion of people without disease who have a negative test

Pre-Test Probability

- the probability a particular patient has a given disease before a test/assessment results are known

Figure 4. Understanding sensitivity and specificity

Figure 4a. Hypothetical population

Figure 4b. Results of diagnostic test on hypothetical population

Figure 4c. Sensitivity of test (e.g. 24/30 = 80% sensitive)

Figure 4d. Specificity of test (e.g. 56/70 = 80% specific)

Source: Loong TW. Understanding sensitivity and specificity with the right side of the brain. *BMJ* 2003;327:716-719

Post-Test Probability

- a revision of the probability of disease after a patient has been interviewed/examined/tested
- calculation process can be explicit using results from epidemiologic studies, knowledge of the accuracy of tests, and a nomogram/Bayes' theorem
- the post-test probability from clinical examination is the basis of consideration when ordering diagnostic tests or imaging studies
 - after each iteration the resultant post-test probability becomes the pre-test probability when considering new investigations

Sensitivity and specificity are characteristics of the test
 LR depends on the test characteristics, not the prevalence
 PPV and NPV depend on the prevalence of the disease in the population

Effectiveness of Interventions

Effectiveness, Efficacy, Efficiency

- three measurements indicating the relative value (beneficial effects vs. harmful effects) of an intervention
 - **efficacy:** the extent to which a specific intervention produces a beneficial result under ideal conditions (e.g. RCT)
 - ♦ ideal conditions include adherence, close monitoring, access to health resources, etc.
 - **effectiveness:** measures the benefit of an intervention under usual conditions of clinical care
 - ♦ considers both the efficacy of an intervention and its actual impact on the real world, taking into account access to the intervention, whether it is offered to those who can benefit from it, its proper administration, acceptance of intervention, and degree of adherence to intervention
 - **efficiency:** a measure of economy of an intervention with known effectiveness
 - ♦ considers the optimal use of resources (e.g. money, time, personnel, equipment, etc.)

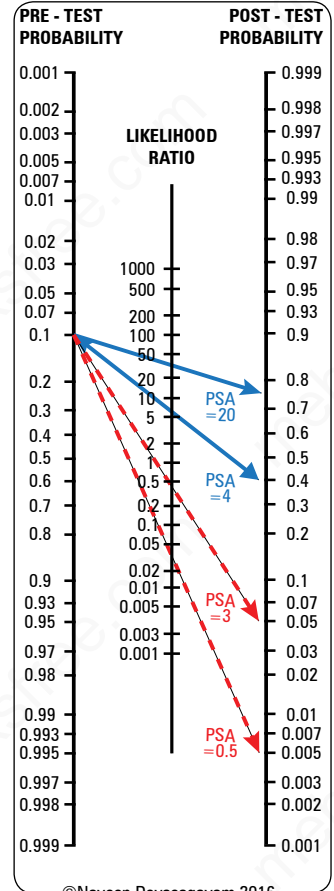

Figure 6. Fagan's likelihood ratio nomogram: Practical example using PSA levels to calculate post-test probability of prostate cancer

Source: Modified from Holmstrom B, Johansson M, Bergh A, et al. Prostate specific antigen for early detection of prostate cancer: longitudinal study. *BMJ* 2009;339:b3537

		Disease (e.g. lung CA)		
		Present	Absent	Total
Exposure (e.g. smoking)	Present	A	B	A + B
	Absent	C	D	C + D
Total		A + C	B + D	A + B + C + D

Case-Control Study

$$\text{odds ratio (OR)}^* = \frac{A}{C} \div \frac{B}{D} = \frac{A \times D}{B \times C}$$

Cohort Study

$$\frac{A}{A + B} = \text{incidence rate of health outcome in exposed} \quad \frac{C}{C + D} = \text{incidence rate of health outcome in non-exposed}$$

$$\text{relative risk} = \frac{A}{A + B} \div \frac{C}{C + D} \quad \text{attributable risk (AR)}^{***} = \frac{A}{A + B} - \frac{C}{C + D}$$

*Ratio of the odds in favour of the health outcome among the exposed to the odds in favour among the unexposed
 **Ratio of the risk of a health outcome among exposed to the risk among the unexposed
 ***Rate of health outcome in exposed individuals that can be attributed to the exposure

Figure 7. Measures of effect by study type

Number Needed to Treat (NNT)

- number of patients who need to be treated to achieve one additional favourable outcome
- only one of many factors that should be taken into account in clinical or health system decision making (e.g. must take into account cost, ease, feasibility of intervention)
 - a condition with death as a potential outcome can have a higher NNT (and be acceptable), as compared to an intervention to prevent an outcome with low morbidity, in which a low NNT would be necessary

Number Needed to Harm (NNH)

- number of patients who, if they received the experimental treatment, would lead to one additional patient being harmed, compared with patients who received the control treatment

Adherence (formerly compliance)

- degree to which a patient follows a treatment plan

Coverage

- extent to which the services rendered cover the potential need for these services in a community
- Sources: Shah, CP. Health Indicators and Data Sources. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003
 The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health.

Equations to Assess Effectiveness
 CER = control group event rate
 EER = experimental group event rate
 RR = EER/CER
 ARR = CER - EER
 NNT = 1/ARR

Beware
 Do not be swayed by a large RR or odds ratio, as it may appear to be large if event rate is small to begin with. In these cases AR is more important (e.g. a drug which lowers an event which occurs in 0.1% of a population to 0.05% can boast a RR of 50%, and yet the AR is only 0.05%, which is not nearly as impressive)

NNT
 Consult <http://www.thennt.com> for quick summaries of evidence-based medicine (includes NNT, LR, and risk assessments)

Types of Study Design

Qualitative vs. Quantitative

Table 6. Qualitative vs. Quantitative Study Designs

Qualitative	Quantitative
Often used to generate hypothesis (Why? What does it mean?)	Often tests hypothesis (What? How much/many?)
"Bottom up" approach Observation → pattern → tentative hypothesis → theory	"Top down" approach Theory → hypothesis → observation → confirmation
Sampling approach to obtain representative coverage of ideas, concepts, or experiences	Sampling approach to obtain representative coverage of people in the population
Narrative: rich, contextual, and detailed information from a small number of participants	Numeric: frequency, severity, and associations from a large number of participants

Source: Adapted from <http://phprimer.afmc.ca>

Source: The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health.

Quantitative Research Methods

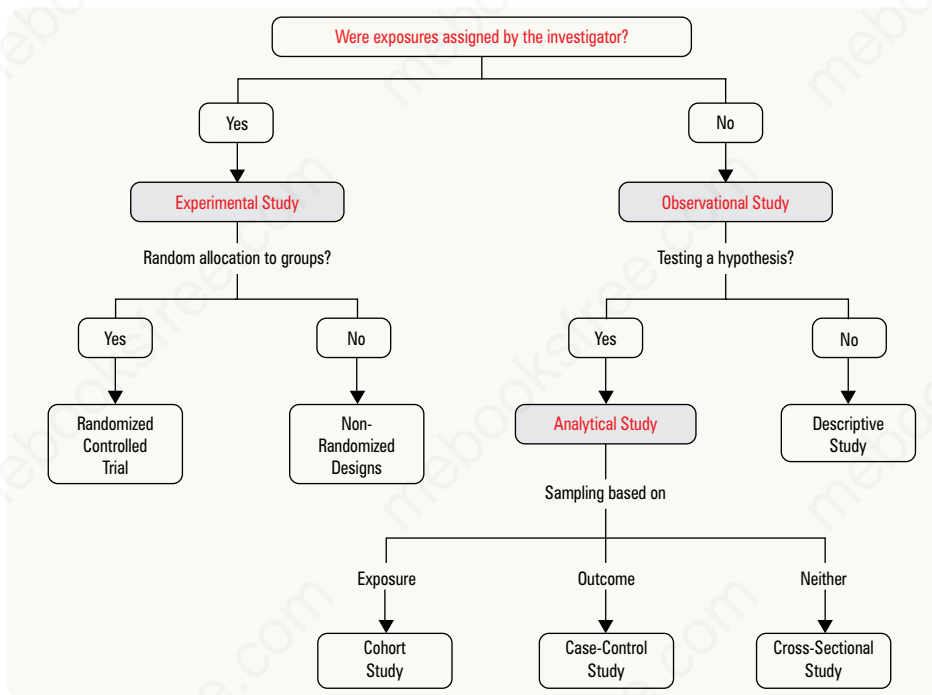

Figure 8. Quantitative study designs

Source: Adapted from <http://phprimer.afmc.ca>

Formulating a Research Question

PICO

Population/Patient Characteristics
 Intervention/Exposure of Interest
 Comparison Group or Control Group
 Outcome that you are trying to prevent or achieve

Observational Study Designs

- observational studies involve neither the manipulation of the exposure of interest nor randomization of the study subjects
- there are two main subtypes of observational studies: descriptive and analytic studies

Descriptive Studies

- describe the events and rates of disease with respect to person, place and time; estimates disease frequency and time trends
- can be used to generate an etiologic hypothesis and for policy planning

Analytic Studies

- observational studies used to test a specific hypothesis
- includes ecological studies, cohort studies, case-control studies, and cross-sectional studies

An example of an ecological fallacy would be concluding that red wine drinking leads to lower risk of death from CVS disease after an ecological study shows that countries with a higher rate of red wine consumption have a lower rate of death from CVS causes

Table 7. Observational Study Designs

Type of Study	Ecological	Cross-Sectional	Case-Control	Cohort
Definition	Units of analysis are populations or groups of people, rather than individuals	Use individual data on exposures and outcomes gathered at the same time	Samples a group of people who already have a particular outcome (cases) and compares them to a similar sample group without that outcome (controls)	Subjects are sampled and, as a group, classified on the basis of presence or absence of exposure to a particular risk factor
Subjects	Aggregated groups (e.g. cities)	Sample of a population	Two or more samples of individuals with and without the outcome(s) of interest (i.e. cases and controls)	One or more cohorts Cohort: group of people with common characteristics (e.g. year of birth, region of residence) Divided into measured exposed vs. non-exposed groups
Methods	Descriptions of the average exposure or risk of disease for a population Can use regression models to test associations between area-level predictors and aggregate outcomes	Collect information from each person at one particular time Tabulate the numbers in groups (e.g. by presence or absence of disease/factor of interest) Make tables and compare groups Estimate prevalence Use regression models to test associations between predictors and outcomes of interest	Select sample of cases of a specific disease during a specific time frame Representative of spectrum of clinical disease Select control(s) Represent the general population To minimize risk of bias, may select more than one control group and/or match controls to cases (e.g. age, gender) Assess past exposures (e.g. EMR, questionnaire) Association can be concluded between the risk factor and the disease (odds ratio)	Collect information on factors from all persons at the beginning of the study Subjects are followed for a specific period of time to determine development of disease in each exposure group Prospective: measuring from the exposure at present to the future outcomes Retrospective: measuring forward in time from exposures in the past to later outcomes Use statistical models to test associations between exposures and disease or other measured outcomes Provides estimates of incidence, relative risk, attributable risk
Advantages	Quick, easy to do Uses readily available data Generates hypothesis	Determines association between variables Quick and uses fewer resources Surveys with validated questions allows comparison between studies	Often used when disease in population is rare (less than 10% of population) due to increased efficiency or when time to develop disease is long Less costly and time consuming	Shows an association between risk factor(s) and outcome(s) Stronger evidence for causation Can consider a variety of exposures and outcomes
Disadvantages	Poor generalizability to individual level (not direct assessment of causal relationship) Ecological fallacy: an incorrect inference from groups to individuals Confounding	Does not allow for assessment of temporal relationship or offer strong evidence for causation between variables Confounding Selection bias Recall bias (see <i>Bias</i> , PH9)	Recall bias (see <i>Bias</i> , PH9) Confounding Selection bias for cases and controls Only one outcome can be measured	Confounding may occur due to individuals self-selecting the exposure, or unknown/unmeasured factors are associated with the measured exposure and outcome Cost and duration of time needed to follow cohort Selection bias
Examples	A study looking at the association between smoking rates and lung cancer rates in different countries at the population level without individual data on both factors	A study that examines the distribution of BMI by age in Ontario at a particular point in time	A famous case control study published by Sir Richard Doll demonstrated the link between tobacco smoking exposure and lung cancer cases at the individual level	A famous cohort study is the Framingham Heart Study, which assessed the long-term cardiovascular risks of diet, exercise, medications such as ASA, etc.

Sources: Shah, CP. Measurement and Investigation. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003.

Rothman KJ, Greenland SG, Lash TL. Modern Epidemiology, 3e. Philadelphia: Wolters Kluwer, 2012.

Experimental Study Designs

- not discussed here are non-randomized control trials (e.g. allocation by clinic or other non-random basis – performed when randomization is not possible)

RANDOMIZED CONTROLLED TRIAL (RCT)

Definition

- subjects are assigned by random allocation to two or more groups, one of which is the control group, the other group(s) receive(s) an intervention

Subjects

- individuals are selected using explicit inclusion/exclusion criteria with recruitment targets guided by sample size calculations

Methods

- random allocation of individuals into two or more treatment groups through a centralized concealed process
- method of assessment to reduce bias
 - single-blind:** subject does not know group assignment (intervention or placebo)
 - double-blind:** subject and observer both unaware of group assignment
 - triple-blind:** subject, observer, and analyst unaware of group assignment
- one group receives placebo or standard therapy
- one or more groups receive(s) the intervention(s) under study
- baseline covariates and outcome(s) are measured and the groups are compared
- all other conditions are kept the same between groups

Advantages

- “gold standard” of studies, upon which the practice of EBM is founded
- provides the strongest evidence for effectiveness of intervention
- threats to validity are minimized with sufficient sample size and appropriate randomization
- randomization is one of few methods that can address selection bias and confounding (including unmeasured confounders)
- allows prospective assessment of the effects of intervention

Disadvantages

- some exposures are not amenable to randomization (e.g. cannot randomize subjects to poverty/wealth or to harmful exposures such as smoking) due to ethical or feasibility concerns
- can be difficult to randomly allocate groups (e.g. communities, neighbourhoods)
- difficult to study rare events, since RCTs would require extremely large sample sizes
- contamination, co-intervention, and loss to follow-up can all limit causal inferences
- can have poor generalizability
- costly

Summary Study Designs

META-ANALYSIS

Definition

- a form of statistical analysis that synthesizes the results of independent studies addressing a common research question, as identified through systematic review

Subjects

- all the studies identified through the review (or all subjects used in original studies for individual-level meta-analysis)

Methods

- selection of relevant studies from the published literature which meet quality criteria
- statistical models used to combine the results of each independent study
- provides a summary statistic of overall results as well as graphic representation of included studies (forest plot)

Advantages

- attempts to overcome the problem of reduced power due to small sample sizes of individual studies
- ability to control for inter-study variation
- can address questions (e.g. subgroup analyses) that the original studies were not powered to answer

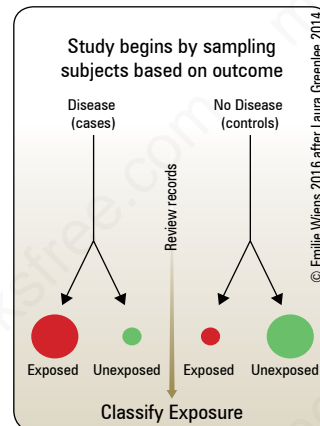

Figure 9. Case-control study

Adapted from <http://phprimer.afmc.ca>

Figure 10. Cohort study

Adapted from <http://phprimer.afmc.ca>

Analysis Per-Protocol Analysis (PP)

Strategy of analysis in which only patients who complete the entire study are counted towards the results

Intention-to-Treat Analysis (ITT)

When groups are analyzed exactly as they existed upon randomization (i.e. using data from all patients, including those who did not complete the study)

An example of an RCT is the SPARCL trial, which demonstrated intense lipid-lowering with atorvastatin reduces the risk of cerebro- and cardiovascular events in patients with and without carotid stenosis when compared to placebo

An example of a meta-analysis is one that compares the effects of ACE inhibitors, CCBs, and other antihypertensive agents on mortality and major cardiovascular events by compiling and analyzing data from a full set of reported RCTs

Disadvantages

- sources of bias may not be controlled for
- reliance on published studies may increase the potential conclusion of an effect as it can be difficult to publish studies that show no significant results (publication bias)
- the decision to include/reject a particular study is subjective

The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health.

Consult the Cochrane Library of Systematic Reviews (<http://www.cochranelibrary.com>) for high-quality systematic reviews and meta-analyses

Example Calculation

Data set: 17, 14, 17, 10, 7

$$\text{Mean} = (17 + 14 + 17 + 10 + 7) \div 5 = 13$$

Median (write the list in order, median is the number in the middle)

$$= 7, 10, 14, 17, 17 = 14$$

Mode (number repeated more often) = 17

$$\text{Range} = 17 - 7 = 10$$

$$\text{Variance} = [(17 - 13)^2 + (14 - 13)^2 + (17 - 13)^2 + (10 - 13)^2 + (7 - 13)^2] \div 4 = 19.5$$

$$\text{Standard Deviation} = \sqrt{\text{variance}} = \sqrt{19.5} = 4.42$$

Methods of Analysis

Distributions

- distribution describes the probability of events
- normal (Gaussian) or non-normal (binomial, gamma, skewed, etc.)
- characteristics of the normal distribution
 - mean = median = mode
 - 67% of observations fall within one standard deviation of the mean
 - 95% of observations fall within two standard deviations of the mean
- measures of central tendency
 - **mean:** sum of each observations' data (e.g. ages) divided by total number of observations
 - **median:** value of the 50th percentile; a better reflection of the central tendency for a skewed distribution
 - **mode:** most frequently observed value in a series
- measures of dispersion
 - **range:** the largest value minus the smallest value
 - **variance:** a measure of the spread of data
 - **standard deviation:** the average distance of data points from the mean (the positive square root of variance)
- given the mean and standard deviation of a normal or binomial distribution curve, a description of the entire distribution of data is obtained

Data Analysis

Statistical Hypotheses

- null (H_0)
 - the default hypothesis; often states there is no relationship between two variables
- alternative (H_1)
 - the hypothesis that we are interested in; often states there is a relationship between two variables
 - we can find evidence against H_0 but we can never 'prove' H_1

Type I Error (α Error)

- the null hypothesis is falsely rejected (i.e. concluding an intervention X is effective when it is not, or declaring an observed difference to be real rather than by chance)
- the probability of this error is denoted by the p-value
- studies tend to be designed to minimize this type of error, since a type I error can have larger clinical significance than a type II error

Type II Error (β Error)

- the null hypothesis is falsely accepted (i.e. stating intervention X is not effective when it is, or declaring an observed difference/effect to have occurred by chance when it is present)
- by convention a higher level of error is often accepted for most studies
- can also be used to calculate statistical power

Power

- probability of correctly rejecting a null hypothesis when it is in fact false (i.e. the probability of finding a specified difference to be statistically significant at a given p-value)
- power increases with an increase in sample size
- power = $1 - \beta$, and is therefore equal to the probability of a true positive result

Statistical Significance

- the probability that the statistical association found between variables is due to random chance alone (i.e. there is no association)
- the preset probability is set sufficiently low that one would act on the result; frequently $p < 0.05$
- when statistical tests result in a probability less than the preset limit, the results are said to be statistically significant (denoted by the α -value)

Figure 11. Distribution curves

Type I (α) Error

"There Is An Effect" where in reality there is none

Clinical Significance

- measure of clinical usefulness (e.g. 1 mmHg BP reduction may be statistically significant, but may not be clinically significant)
- depends on factors such as cost, availability, patient compliance, and side effects in addition to statistical significance

Confidence Interval (CI)

- provides a range of values within which the true population result (e.g. the mean) lies
- frequently reported as 95% CI (i.e. 95% chance that the true value is within this data range)
- bounded by the upper and lower confidence limits

Data

- information collected from a sample of a population
- there are 4 overall levels of measurement for quantitative data
 - **categorical** (e.g. blood type, marital status)
 - **ordinal** (e.g. low, medium, high)
 - **interval** (e.g. °C, time of day)
 - **ratio** (e.g. serum cholesterol, hemoglobin, age)

Validity/Accuracy (of a measurement tool)

- how closely a measurement reflects the entity it claims to measure

Reliability/Precision

- how consistent multiple measurements are when the underlying subject of measurement has not changed
- may be assessed by different observers at the same time (inter-rater reliability) or by the same observer under different conditions (test-retest reliability)

Internal Validity

- degree to which the findings of the sample truly represent the findings in the study population
- dependent on the reliability, accuracy, and absence of other biases

External Validity (i.e. Generalizability)

- degree to which the results of the study can be generalized to other situations or populations

A wider confidence interval implies more variance than a tighter confidence interval given the same critical value

Figure 12. Validity vs. reliability

Common Statistical Tests

Table 8. Statistical Tests

	Two-sample Z-Test	Analysis of Variance (ANOVA)	Chi-Squared Test (χ^2)	Linear Regression	Logistic Regression	Pearson product-moment correlation (Pearson's r)
What are you trying to show?	Compare the mean values of an outcome variable between two groups (e.g. difference in average BP between men and women)	Compare the mean values of an outcome variable between two or more groups (e.g. difference in average BP between persons in three towns)	Test the correspondence between a theoretical frequency distribution and an observed frequency distribution (e.g. if one sample of 20 patients is 30% hypertensive and another comparison group of 25 patients is 60% hypertensive, a chi-squared test determines if this variation is more than expected due to chance alone)	Looks at associations between two or more variables (e.g. age and blood pressure)	Shows how a change in one explanatory variable affects the status (e.g. ill vs. non-ill) of the outcome variable	Assesses the strength of the linear relationship between two variables. Ranges from -1 (negative association, i.e. Increases in one variable are associated with decreases in another) to 1 (positive association, increases in one variable are associated with increases in the other). A correlation of 0 indicates no relationship
What kind of variables do you measure?	Continuous data	Continuous data	Categorical (2 or more)/ordinal	Continuous	Categorical (outcomes usually dichotomous)	Continuous
Dependent Variable	Continuous data	Continuous data	Categorical (2 or more)/ordinal	Continuous	Categorical (outcomes usually dichotomous)	Continuous
Independent Variable	Dichotomous	Categorical/Ordinal (2 or more)	Categorical/Ordinal (2 or more)	Continuous/Ordinal/Categorical	Continuous/Ordinal/Categorical	Continuous
Assumptions	Data follow a normal/t-distribution Equal variances Data are independent	"Normal" distribution of dependent variable's error term Data are independent	Expected counts must be at least 5 for all cells in n by n table Data are independent	Dependent variable's error term has "normal" distribution Linear relationship between variables Homoskedasticity No influential values Data are independent	Linearity (on logit scale) No influential values Model has adequate goodness-of-fit Data are independent	Underlying relationship is linear Data for both variables are Normally distributed Data are independent

What's the difference between Pearson and Spearman correlation?
Different types of correlation are used for different levels of measurement. Pearson is for continuous and Normal data, Spearman is for ordinal or non-Normal data. There are other forms of correlation for other levels of measurement (e.g. Tetrachoric/polychoric)

Causation

Criteria for Causation (Sir Bradford Hill)

- strength of association:** the frequency with which the factor is found in the disease, and the frequency with which it occurs in the absence of disease
- consistency:** is the same relationship seen with different populations or study design?
- specificity:** is the association particular to your intervention and measured outcome?
- temporal relationship:** did the exposure occur before the onset of the disease?
- biological gradient:** finding a dose response relationship between the exposure-outcome
- biological plausibility:** does the association/causation make biological sense?
- coherence:** can the relationship be explained/accounted for based on what we know about science, logic, etc.?
- experimental evidence:** does experimental evidence support the association (e.g. is there improvement?)
- analogy:** do other established associations provide a model for this type of the relationship?

Note: Not all criteria must be fulfilled to establish scientific causation, and the modern practice of EBM emphasizes 'experimental evidence' as superior to other criteria for experimental causation review. However, many causation questions in health cannot be answered with experimental methods.

Source: Bradford Hill A. The environment and disease: association or causation. Proc R Soc Med 1965; 58(5): 295-300.

Assessing Evidence

- critical appraisal is the process of systematically examining research evidence to assess validity, results, and relevance before using it to inform a decision

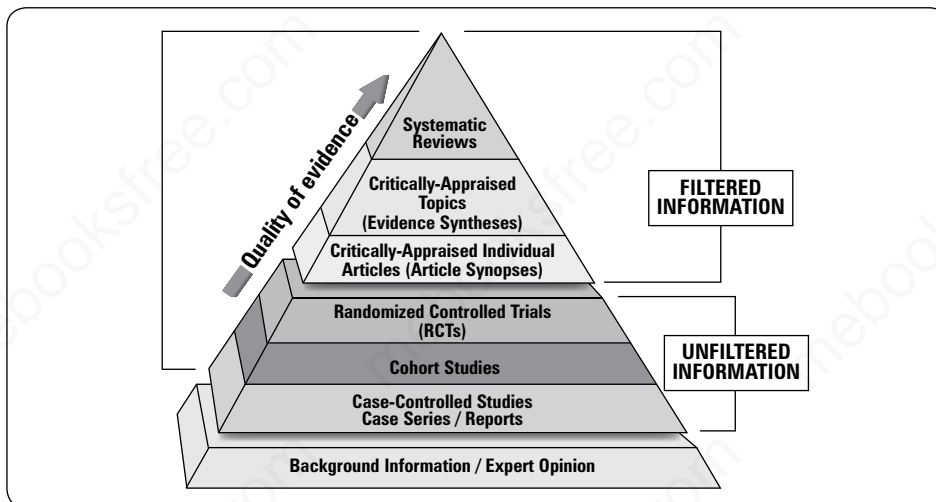

Figure 13. Pyramid of pre-appraised evidence

© Copyright 2006. Trustees of Dartmouth College & Yale University. All rights reserved. Produced by Glover J., Izzo D., Odato K. and Wang L.

A. Are the results of the study valid?

- see below for classifications of evidence that has already been assessed; see sidebar for assessing primary studies

B. What are the results?

- what was the impact of the treatment effect?
- how precise was the estimate of treatment effect?
- what were the confidence intervals and power of the study?

C. Will the results help me in caring for my patients?

- are the results clinically significant?
- can I apply the results to my patient population?
- were all clinically important outcomes considered?
- are the likely treatment benefits worth the potential harm and costs?

Beware

Correlation ≠ Causation

e.g. There is evidence of a direct correlation between the amount of ice cream sold and the amount of deaths in swimming pools. Of course, ice cream does not cause drowning, rather, they both increase in the summer

Criteria for Causation

ACCESS PTB

Analogy
Consistency
Coherence
Experimental evidence
Strength of association
Specificity
Plausibility
Temporal relationship
Biological gradient

Validity

- The degree to which the outcome observed in the study can be attributed to the intervention

5 Questions About the Validity of Primary Studies

- Were the patients randomized?
- Was the follow-up of patients sufficiently long and complete?
- Were all patients analyzed in the groups to which they were randomized?
- Were the groups treated equally except for the intervention?
- Were the patients and clinicians kept blind to treatment?

Other Questions to Consider

- Were the groups similar (i.e. demographics, prognostic factors) at the start of the trial?
- Were the appropriate and valid exposure and outcome measures obtained?
- Were outcome assessors aware of group allocation?
- Was contamination reported?
- Were ethical issues continuously upheld?

Source: The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health.

Levels of Evidence: Classifications Cited in Guidelines/Consensus Statements

Level I evidence: based on RCTs (or meta-analysis of RCTs) big enough to have low risk of incorporating FP or FN results

Level II evidence: based on RCTs too small to provide Level I evidence; may show positive trends that are non-significant, or have a high risk of FN results

Level III evidence: based on non-randomized, controlled or cohort studies; case series; case-controlled; or cross-sectional studies

Level IV evidence: based on opinion of respected authorities or expert committees, as published consensus conferences/guidelines

Level V evidence: opinions of the individuals who have written/reviewed the guidelines (i.e. Level IV evidence), based on experience/knowledge of literature/peer discussion

Notes: These 5 levels of evidence are not direct evaluations of evidence quality or credibility; they reflect the nature of the evidence. While RCTs tend to be most credible (with <III), level III evidence gains credibility when multiple studies from different locations and/or time periods report consistent findings. Level IV and V evidence reflects decision-making that is necessary but in the absence of published evidence.

Figure 14. Levels of evidence classifications

Note: This is only one method of classifying evidence. Various systems exist, but operate within the same premise that certain types of evidence carry more weight than others

Health Services Research

Continuous Quality Improvement

Quality Improvement (QI)

- a means of evaluating and improving processes; focusing more on systems and systematic biases, which are thought to cause variation in quality
- measures to increase efficiency of action with the purpose of achieving optimal quality

Quality Assurance

- process to guarantee the quality of health care through improvement and attainment of set standards
- **“five-stage process of quality assurance”** (Public Health and Preventative Medicine in Canada, Shah)
 1. formulation of working goals
 2. procedural changes to implement those goals
 3. regular comparison of current performance with original goals
 4. development of solutions to bring performance closer to goals
 5. documentation of quality assurance activities

Quality Control

- a process of surveying the quality of all factors involved in the process to maintain standards

Continuous Quality Improvement

- the process of ongoing service/product refinement via the vigilant review of expectant issue detrimental to the system and regular incorporation of improvements

Quality Management

- combination of several processes (assurance, control, improvement) to maintain consistent quality

Total Quality Management

- management principle for advancing quality while minimizing additional expenditures
- focuses on the entire system rather than discrete elements

Audit

- methodical analysis of a quality system by quality auditors
- to determine whether quality processes and results comply with goals, and whether processes have been implemented effectively

Systems Analyses Tools

1. **5 Whys**: brainstorming to simplify the process of change; continue asking ‘why’ until the root of the problem is discovered
2. **Ishikawa Diagrams** (i.e. Fishbone Diagrams): identify generic categories of problems that have an overall contribution on the effect
3. **Defect check sheets**: consider all defects and tally up the number of times the defect occurs
4. **Pareto Chart**: x vs. y chart; x-axis = defect categories, y-axis = frequency; plot cumulative frequency on the right y-axis; purpose is to highlight most important among large set of factors contributing to defects/poor quality

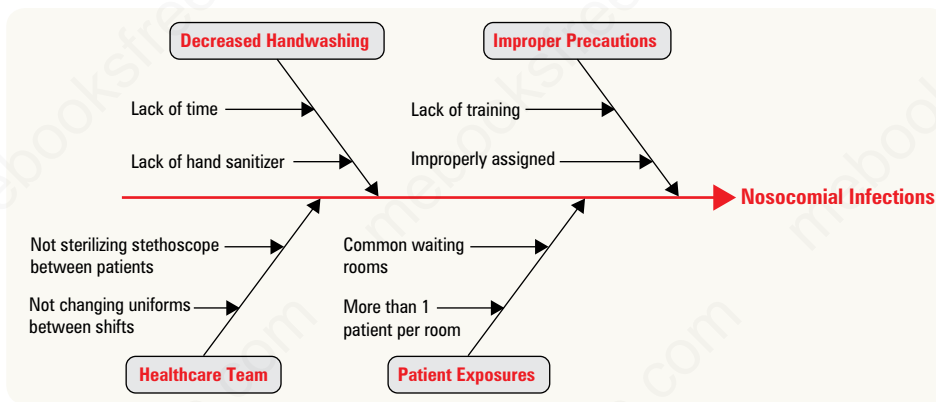

Figure 15. Ishikawa diagram

Precede-Proceed Model

- tool for designing, implementing, and evaluating health interventions/programs

Table 9. Precede-Proceed Model

PRECEDE Phase	PROCEED Phase
Phase 1 – Identify the ultimate desired result	Phase 5 – Implementation (design and conduct the intervention)
Phase 2 – Identify health issues and their behavioural and environmental determinants. Set priorities among them.	Phase 6 – Process Evaluation (determine if the program is implemented as planned)
Phase 3 – Identify the predisposing, enabling, and reinforcing factors that affect the behaviours and environmental determinants	Phase 7 – Impact Evaluation (measure intermediate objectives – predisposing, enabling, and reinforcing factors)
Phase 4 – Identify the administrative and policy factors that influence what can be implemented	Phase 8 – Outcome Evaluation (measure desired result)

Cost Analysis**Cost Benefit Analysis (CBA)**

- an analysis which compares the total expected costs with the total expected benefits of actions in order to choose the most profitable or beneficial options
- costs are controlled for inflation and market changes so that the effect of the change is evaluated over a consistent, preset financial value

Cost Effectiveness Analysis (CEA)

- ratio of the change in cost (numerator) to change in effect (denominator) in response to a new strategy or practice
 - some examples of changes in effect (denominator) could be years of life gained or sight-years gained
 - the numerator highlights the cost of the health gain
 - the most commonly used outcome measure is quality-adjusted life years (QALY) (see *Quality Adjusted Life Year, PH8*)
- can be used where an extensive cost benefit analysis is not applicable or appropriate

Outbreak of Infectious Diseases**Definitions****Endemic**

- consistent existence of infectious agent or disease in a given population or area (i.e. usual rate of disease)

Outbreak

- incidence of new cases beyond the usual frequency of disease in a particular population or community over a given period of time
- an epidemic that is in a confined location, has a short duration, or begins acutely

Epidemic

- an outbreak or excessive rate of disease that rapidly spreads to a large number of individuals (e.g. SARS epidemic)

Pandemic

- epidemic over a wide area, crossing international boundaries, and affecting an even larger number of people

Attack Rate

- cumulative incidence of infection within a defined group observed during a specific period of time in an epidemic
- calculated by dividing the total number of people who develop clinical disease by the population at risk, usually expressed as a percentage

Secondary Attack Rate

- the proportion of individuals who develop disease as a result of exposure to primary contacts during the incubation period
- infectiousness reflects the ease of disease transmission and is usually measured by the secondary attack rate

Virulence

- extent of sickness caused in host by a disease-causing agent
- ratio comparing those with the disease who are critically affected over the total number of individuals in the population who have the disease

Case-Fatality Rate (CFR)

- proportion of individuals with the disease who perish as a result of the illness
- most frequently applied to a specific outbreak of acute disease in which all patients have been followed for an adequate period of time to include all attributable deaths
- must be clearly differentiated from the mortality rate

Mortality Rate/Crude Death Rate

- estimation of the portion of the population that dies during a specified period from all causes of death

Steps to Control an Outbreak

Adopted from AFMC Primer on Population Health**1. Determine whether an outbreak****2. Develop case definitions and identify outbreak cases**

- consider history, signs, symptoms, test results, and timing to balance sensitivity and specificity in case definition
- consider engaging in active surveillance to identify additional cases

3. Develop hypotheses regarding outbreak cause/source and implement initial control measures

- identify source, population at risk
- manage cases, including appropriate isolation
- reinforce importance of routine and additional precautions

4. Test hypotheses using surveillance data or special studies

- describe cases by person, place, and time to create a line listing
- plot an epidemic curve:
 - histogram with time on the x-axis and number of cases on the y-axis
 - often follows a characteristic pattern based on the nature of the exposure and/or infectious agent:
 - point source epidemic: exposure is brief and not continuous or propagated (e.g. single contaminated dish at a picnic)
 - extended source epidemic: exposure may be continuous (or intermittent if peaks are irregular) and lasts for days or weeks (e.g. ongoing or intermittent contamination of drinking water)
 - propagated epidemic: series of peaks demonstrating only a few cases initially, but then ongoing person-to-person transmission (e.g. influenza virus)

5. Re-evaluate hypothesis and adjust control measures**6. Create and implement plans for future prevention and control**

- examples include prevention of transmission in the environment (e.g. handwashing and sterilization techniques), immunization of hosts, and education of health care professionals and the public

**Infection Control Precautions**(see **Family Medicine, FM49**)**Contact (impetigo, chicken pox, warts)**

- Wash hands
- Gloves
- Gown
- Wipe equipment after use

Airborne (TB)

- Contact precautions PLUS
- N95 mask (fit tested)
- Negative pressure room

Droplet (influenza, mumps, pneumonia)

- Contact precautions PLUS
- Goggles/face shield
- Surgical mask

<http://www.oahpp.ca/resources/documents/pidac/Routine%20Practices%20and%20Additional%20Precautions.pdf>

For specific examples, see "Communicable Diseases" section in: Shah CP. Public Health and Preventive Medicine in Canada Toronto: Elsevier, 5th edition, 2003

**Active Surveillance**

Outreach such as visits or phone calls by the public health/surveillance authority to detect unreported cases (e.g. an infection control nurse goes to the ward and reviews temperature charts to see if any patient has a nosocomial infection)

Passive Surveillance

A surveillance system where the public health/surveillance authority depends on others to submit standardized forms or other means of reporting cases (e.g. ward staff notify infection control when new cases of nosocomial infections are discovered)

Infection Control Targets

- interventions should target host, agent, environment, and their interactions

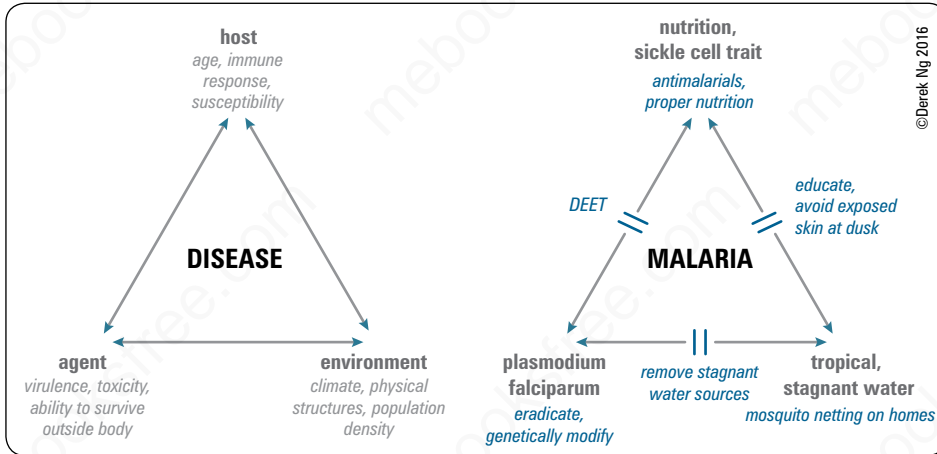

Figure 17. Epidemiology triad as framework for infection control interventions: Practical example using malaria

Figure 16. Epidemic curves

Figure 16a. Point source epidemic curve

Figure 16b. Extended continuous source epidemic curve

Figure 16c. Propagated source epidemic curve

Environmental Health

Definition

- study of the association between environmental factors, both constructed and natural, and health
- environmental exposures
 - four common hazards: chemical, biological, physical, and radiation
 - four main reservoirs: air, food, water, and soil
 - three main routes: inhalation, ingestion, or absorption (skin)
 - usually divided into two main settings:
 - workplace (including schools): may see high level exposure in healthy individuals (see *Occupational Health, PH23*)
 - non-workplace: lower levels of exposure over longer period of time. Affects vulnerable populations more severely, such as at extremes of age, immuno-suppressed. May be teratogenic
- health impacts of the environment also include factors such as urban planning and how individuals interact with the built environment (e.g. safe pedestrian and bicycle paths can facilitate more active lifestyles)

Table 10. Environmental Health Jurisdiction

Public Health Unit	Enforcement of water and food safety regulations (including restaurant food safety) Sanitation Assessment of local environmental risks Monitoring and follow-up of reportable diseases
Municipal Government	Waste disposal Recycling Water and sewage treatment/collection/distribution
Provincial and Territorial Government	Water and air quality standards Industrial emission regulation Toxic waste disposal
Federal Government	Designating and regulating toxic substances Regulating food products (e.g. Health Canada) Setting policy for pollutants that can travel across provincial boundaries
International	Multilateral agreements (e.g. Kyoto Protocol, UN Convention on Climate Change, International Joint Commission)

Drugs

Marshall L, Weir E, Abelson A, Sanborn MD. Identifying and managing adverse environmental health effects: 1. Taking an exposure history. CMAJ 2002 Apr 16;166(8):1049-1055.

Risk Assessment

Adopted from p.250, Sixth Edition of "A Dictionary of Epidemiology" by Miquel Porta

Hazard Identification

- what is the hazard involved?
- assess potential hazards by taking environmental health history

Risk Characterization

- is the identified agent likely to elicit the patient's current symptoms?
- review known health impacts of the hazard and identify specific properties that contribute to or diminish adverse effects (e.g. evaluate threshold levels)

Exposure Assessment

- is the patient's exposure to the environmental agent sufficient to have caused the current symptoms?
- quantify exposure through direct measurement or by reviewing frequency and nature of contact with hazard

Air

Biological Hazards

- moulds thrive in moist areas; 10-15% of the population allergic
- bacteria survive as spores and aerosols, can be distributed through ventilation systems (e.g. *Legionella*)
- dust mites (year-round) and pollens (seasonal) can trigger upper and lower-airway symptoms

Chemical Hazards

- ground-level ozone
 - main component of smog with levels increasing in major cities
 - worsens asthma, irritates upper airway
- carbon monoxide (fossil fuel-related, common byproduct of combustion)
 - aggravates cardiac disease at low levels
 - headache, nausea, dizziness at moderate levels
 - fatal at high levels
- sulphur dioxide (fossil fuel-related), nitrogen oxides
 - contribute to acid rain and exacerbate breathing difficulties
- organic compounds at high levels (e.g. benzene, methylene chloride, tetrachloroethylene)
 - tend to be fat-soluble, easily absorbed through skin and difficult to excrete
- heavy metal emissions (e.g. nickel, cadmium, chromium)
 - variety of health effects: upper airway disease, asthma, decreased lung function
- second-hand tobacco smoke
 - respiratory problems, increase risk of lung cancer
 - particulates associated with decreased lung function, asthma, upper airway irritation

Radiation Hazards

- sound waves
 - ionizing radiation
 - radon is naturally produced by soil containing uranium or radium, can contaminate indoor air and is associated with a small proportion of lung cancers
- ultraviolet radiation is increasing due to ozone layer destruction and increases risk of skin cancer
 - non-ionizing radiation
 - visible light, infrared, microwave

Water

Biological Hazards

- mostly due to human and animal waste
- Aboriginal Canadians, rural Canadians at higher risk
- bacteria: *Escherichia coli* (e.g. Walkerton, ON), *Salmonella*, *Pseudomonas*, *Shigella*
- protozoa: *Giardia*, *Cryptosporidium* (e.g. North Battleford, SK)

Chemical/Industrial Hazards

- chlorination by-products (e.g. chloroform can cause cancer at high levels)
- volatile organic compounds, heavy metals, pesticides, and other industrial waste products can be present in groundwater
- fluoride at high levels (greater than that of municipal fluoridation) can cause skeletal fluorosis

BPA, The Toxin Concern of 2009

Bisphenol A (BPA) is a chemical compound found in some hard, clear, lightweight plastics and resins. According to the NIH, animal studies suggest that ingested BPA may imitate estrogen and other hormones. In October 2008, Canada became the first country in the world to ban the import and sale of polycarbonate baby bottles containing BPA, stating that although exposure levels are below levels that cause negative effects, current safety margins need to be higher. The US FDA does not consider normal exposure to BPA to be a hazard, however the NIH has some concern that fetuses, infants, and children exposed to BPA may be at increased risk for early-onset puberty, prostate, and breast cancer

Particulate Matter Air Pollution and Cardiovascular Disease: An Update to the Scientific Statement from the American Heart Association

Circulation 2010 Jun 1;121(21):2331-78

A scientific statement by the American Heart Association in 2004 reported that exposure to particulate matter air pollution contributes to cardiovascular morbidity and mortality. An updated American Heart Association statement in 2010 confirmed a causal relationship between particulate matter exposure and cardiovascular morbidity and mortality. The statement reported that such an exposure over several hours to weeks may trigger cardiovascular disease-related mortality and non-fatal events, whereas longer exposures over several years may further increase cardiovascular mortality risk and reduce life expectancy within highly-exposed populations by several months to years.

The Walkerton Tragedy

In May 2000, the drinking water system in the town of Walkerton, ON, became contaminated with *Escherichia coli* O157:H7 and *Campylobacter jejuni*.

Over 2,300 individuals became ill; 27 people developed hemolytic uremic syndrome and 7 individuals died in the outbreak

Source: Ministry of the Attorney General. Report of the Walkerton inquiry. Ontario, 2002

To Fluoridate or Not

At the recommended concentration of 0.8-1.0 mg/L, fluoride reduces cavities by 18-40%, and there is little risk of fluorosis unless other exposures (e.g. toothpaste, rinses, mouthwash, etc.) are swallowed. Opposition raises concerns that the intake is not easily controlled, and that children, and others may be more susceptible to health problems. However, public health experts strongly support fluoridation as an effective measure to prevent dental caries at the community level and reduce dental health inequities

Soil

Biological Hazards

- biological contamination: tetanus, *Pseudomonas*

Chemical Hazards

- contamination sources: rupture of underground storage tanks, use of pesticides and herbicides, percolation of contaminated water runoffs, leaching of wastes from landfills, dust from smelting and coal burning power plants, residue of industrial waste/development (e.g. urban agriculture), lead deposition, leakage of transformers
- most common chemicals: petroleum hydrocarbons, solvents, lead, pesticides, motor oil, other industrial waste products
- infants and toddlers at highest risk of exposure due to hand-mouth behaviours
- dependent on contaminant: leukemia, kidney damage, liver toxicity, neuromuscular blockade, developmental damage to the brain and nervous system, skin rash, eye irritation, headache, nausea, fatigue

Food

Biological Hazards

Table 11. Comparison of Select Biological Contaminants of Food and Effects on Human Health

	Source	Effects
<i>Salmonella</i>	Raw eggs, poultry, meat	GI symptoms
<i>Campylobacter</i>	Raw poultry, raw milk	Joint pain, GI symptoms
<i>Escherichia coli</i>	Various including meat, sprouts Primarily undercooked hamburger meat	Watery or bloody diarrhea Hemolytic uremic syndrome (especially children)
<i>Listeria monocytogenes</i>	Unpasteurized cheeses, prepared salads, cold cuts	Listeriosis: nausea, vomiting, fever, headache, rarely meningitis or encephalitis
<i>Clostridium botulinum</i>	Unpasteurized honey, canned foods	Dizziness, weakness, respiratory failure, GI symptoms: thirst, nausea, constipation
Prion (BSE*)	Beef and beef products	Creutzfeldt-Jakob disease

*BSE = bovine spongiform encephalopathy

- other biological food contaminants include
 - viruses, mould toxins (e.g. aflatoxin has been associated with liver cancer), parasites (e.g. *Toxoplasmosis*, tapeworm), paralytic shellfish poisoning (rare), genetically modified organisms (controversial as to health risks/benefits)

Chemical Hazards

- many persistent organic pollutants are fat-soluble and undergo bioamplification
- drugs (antibiotics, hormones)
- inadequately prepared herbal medications
- food additives and preservatives
 - nitrites highest in cured meats; can be converted to carcinogenic nitrosamines
 - sulphites commonly used as preservatives; associated with sulphite allergy (hives, nausea, shock)
- pesticide residues
 - older pesticides (e.g. DDT) have considerable human health effects
- polychlorinated biphenyls (PCBs)
 - effects (severe acne, numbness, muscle spasm, bronchitis) much more likely to be seen in occupationally exposed individuals than in the general population
- dioxins and furans
 - levels highest in fish and marine mammals, also present in breast milk can cause immunosuppression, liver disease, respiratory disease

Honey and Botulism

Although exceedingly rare, infant botulism has been documented as a form of food poisoning from *C. botulinum* found in honey. When an infant swallows spores of this bacterium, they grow and produce a toxin in the baby's intestine. By the time an infant is 1, its gut has a healthy colony of "good" bacteria that prevents this from occurring

Organic Foods

- Foods designated as "organic" in Canada must conform to the Organic Products Regulations enforced by the Canadian Food Inspection Agency
 - Organic foods are not free of synthetic pesticide residues but typically contain smaller amounts compared to conventionally grown foods
 - Currently, there has not been strong evidence to suggest that eating organic foods is safer or more nutritious compared to eating conventionally grown food
- Source: Organic foods. *Ann Intern Med* 2012;157:348-66.
Health Canada. Pesticides and food, 2011. UpToDate.
Organic foods and children, 2009

Occupational Health

- a field involved in the prevention of illness or injury and the promotion of health in the work environment
- services encompass “health promotion and protection (primary prevention), disease prevention (secondary prevention), and treatment and rehabilitation (tertiary prevention)” (Shah)
- occupational disease may be more difficult to recognize than occupational injury

Taking an Occupational Health History

- current and previous duties at place of employment
- exposures
 - identification: screen for chemical, metal, dust, biological, and physical hazards as well as psychological stressors; review relevant workplace MSDS
 - assessment: duration, concentration, route, exposure controls (e.g. ventilation, personal protective equipment)
- temporal relationship: changes in symptoms in relationship to work environment
- presence of similar symptoms in co-workers
- non-work exposures: home, neighbourhood, hobbies

Occupational Hazards

Table 12. Occupational Hazards

Physical	Chemical	Biological	Psychosocial
<ul style="list-style-type: none"> • Trauma (e.g. fractures, lacerations) • Noise (e.g. hearing loss) • Temperature <ul style="list-style-type: none"> • Heat cramps, heat exhaustion, heat stroke • Hypothermia, frostbite • Air pressure (barotrauma, decompression sickness) • Ergonomic <ul style="list-style-type: none"> • Repetitive use/overuse injuries, excessive force, awkward postures, poorly designed physical work environment • Tenosynovitis, bursitis, carpal tunnel syndrome • Radiation <ul style="list-style-type: none"> • Non-ionizing: visible light, infrared • Ionizing: UV, x-rays, γ rays • Electricity 	<ul style="list-style-type: none"> • Organic solvents (e.g. benzene, methyl alcohol; most toxic is carbon tetrachloride) • Mineral dusts (e.g. silica leads to silicosis and predisposition to TB, asbestos leads to diffuse fibrosis and mesothelioma, coal leads to pneumoconiosis) • Heavy metals (e.g. nickel, cadmium, mercury, lead) • Gases (e.g. halogen gases, sulphur dioxide, carbon monoxide, nitrogen oxides) • Second-hand smoke (causal factor for lung cancer, lung disease, heart disease, asthma exacerbations; may be linked to miscarriage) • Skin diseases (major portion of compensations, e.g. contact dermatitis, occupational acne, pigmentation disorders) 	<ul style="list-style-type: none"> • Exposure to bacteria, viruses, fungi, protozoa, Rickettsia • Blood should be considered a potentially toxic substance due to blood-borne infectious diseases (e.g. HIV, hepatitis B) • Consider exposure to disease in endemic countries, travellers from endemic countries, or recent travel history in the setting of acute onset of symptoms (e.g. malaria, SARS, TB) 	<ul style="list-style-type: none"> • Workload stressors • Responsibility • Fear of job loss • Geographical isolation • Shift work • Bullying • Harassment (sexual/non-sexual) • Incurs high cost from absenteeism, poor productivity, mental illness (e.g. post-traumatic stress disorder)

Workplace Legislation

- universal across Canada for corporate responsibility in the workplace: due diligence, application of Workplace Hazardous Materials Information System (WHMIS), existence of joint health and safety committees in the workplace with representatives from workers and management
- jurisdiction in Canada is provincial (90% of Canadian workers), except for 16 federally regulated industries (e.g. airports, banks, highway transport) under the *Canada Labour Code*
- Ontario's *Occupational Health and Safety Act*
 - sets out rights of workers and duties of employers, procedures for workplace hazards, and law enforcement
 - workers have the right to:
 - ♦ **participate** (e.g. have representatives on joint health and safety committees)
 - ♦ **know** (e.g. be trained and have information about workplace hazards)
 - ♦ **refuse work** (e.g. workers can decline tasks they feel are overly dangerous)
 - note: For some occupations, this right is restricted if, for example, danger/risk is normal part of work or refusal would endanger others (e.g. police, firefighters, some health care workers)
 - ♦ **stop work** (e.g. ‘certified’ workers can halt work they feel is dangerous to other workers)

Taking an Occupational Health Hx WHACS

What do you do?

How do you do it?

Are you concerned about any particular exposures on or off the job?

Co-workers or others with similar problems?

Satisfied with your job?

J Occup Environ Med 1998;40:680-684

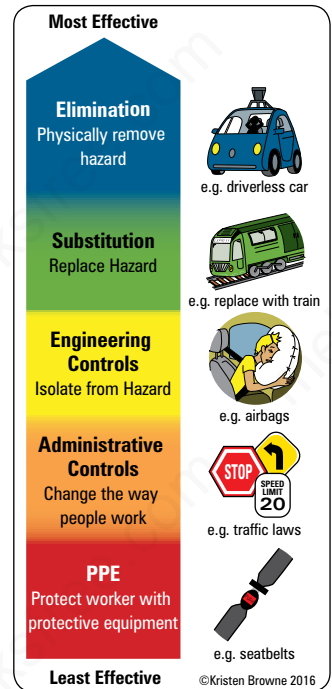

Figure 18. Hierarchy of controls for reduction of occupational exposures

Source: Modified from CDC, 2015. Hierarchy of controls. <http://www.cdc.gov/niosh/topics/hierarchy/>

Ontario's Workplace Safety and Insurance Act (Each province will have their own similar legislation)

- Establishes Workplace Safety and Insurance Board (WSIB), an autonomous government agency that oversees workplace safety training and administers insurance for workers and employers
- WSIB decides benefits for workers, which may include reimbursement for
 - Loss of earned income
 - Non-economic loss (e.g. physical, functional, or psychological loss extending beyond the workplace)
 - Loss of retirement income
 - Health care expenses (e.g. first-aid, medical treatment)
- Survivor benefits (e.g. dependents and spouses can receive benefits)
- Employers pay for costs (e.g. no government funding)
- No-fault insurance (e.g. worker has no right to sue the employer) in return for guaranteed compensation for accepted claims
- Negligence is not considered a factor
- Physicians are required to provide the WSIB with information about a worker's health without a medical waiver once a claim is made

For more information: <http://www.wsib.on.ca/en/community/WSIB>

- employers must take precautions to protect the health and safety of employees and investigate concerns
- enforced by Ministry of Labour via inspectors
- *Health Protection and Promotion Act (HPPA)* (Ontario)
 - Medical Officer of Health has right to investigate and manage health hazards where workplace exposures may impact non-workers (e.g. community members living close to the work site)

Workplace Health Promotion and Protection

- pro-active preventative health measures can reduce workplace illness or injury
 - identifying workplace hazards (e.g. through material safety data sheets [MSDS])
 - assessing risk
 - reducing exposure : changes to work environment including elimination, substitution, and isolation of hazard (e.g. engineering controls) more effective than changes to how people work (e.g. administrative controls) and personal protective equipment

Workplace Disease Prevention and Identification

- avoid the development of disease with pro-active worker health surveillance
 - periodic examinations to facilitate diagnosis before symptoms develop:
 - PFT for asthma (e.g. occupational dust exposure)
 - audiograms for hearing loss (e.g. occupational noise exposure)
 - substance misuse screening useful if concern surrounds decreased employee functioning

Workplace Treatment and Rehabilitation

- treatment of the disease or injury to facilitate safe and timely return to the workforce
- may require rehabilitation, retraining, change in job duties, and/or workers' compensation (WSIB)
- advise relevant authorities if necessary (e.g. report notifiable diseases to public health, conditions impeding driving to Ministry of Transportation, *see Other Reportable Conditions, PH25*)

Appendix – Mandatory Reporting

Reportable Diseases

As an essential part of the health system, physicians in Canada are required by law to report certain diseases to public health for the following reasons:

1. to control the outbreak
 - if the disease presents an outbreak threat (e.g. measles, Salmonella, respiratory diseases in institutions)
2. to prevent spread
 - if the disease presents a significant threat to individuals or a subset of the population (e.g. Lassa Fever)
3. for surveillance
 - if the disease is preventable with immunization (e.g. polio, diphtheria, congenital rubella)
4. if infected individuals require education, treatment and/or partner notification (e.g. gonorrhoea, TB)
5. reporting details (website, office etc.)
 - some are more urgent than others (must contact MOH)
 - physicians should also report unlisted diseases that appear in clusters

Occupational Health Statistics

- 1 in 68 employed workers in 2010 received workers compensation due to injury or harm on the job
- 4,405 fatal work injuries in the United States in 2013; rate = 3.2/100,000 workers

Source: Employment and Social Development Canada. Work-related injuries, 2015
U.S. Bureau of Labour Statistics. Census of Fatal Occupational Injuries Charts, 1992-2013, 2014

Information about worker's compensation at:
<http://www.awcbc.org/en/index.asp>

The following list is based on the reportable diseases in Ontario for 2015. Each province will have a similar legislation.

Note: Diseases marked * (and Influenza in institutions) should be reported immediately to the Medical Officer of Health by either telephone (24 hours a day, 7 days a week) or fax (Mon-Fri, 8:30 am – 4:30 pm only).

Other diseases can be reported the next working day by fax, phone or mail.

Source: Health Protection and Promotion Act, O. Reg. 559/91, amended to O. Reg. 49/07 (update)

Acquired Immunodeficiency Syndrome (AIDS)	Haemophilus influenzae b disease, invasive*	Q Fever*
Acute flaccid paralysis <15 yr	Hantavirus pulmonary syndrome*	
Amoebiasis	Hemorrhagic fevers*, including:	Rabies*
Anthrax*	1. Ebola virus disease*	Respiratory infection outbreaks in institutions*
	2. Marburg virus disease*	Rubella*
	3. Other viral causes*	Rubella, congenital syndrome
Botulism*	Hepatitis, viral*:	
Brucellosis*	1. Hepatitis A*	Salmonellosis
	2. Hepatitis B	Severe Acute Respiratory Syndrome (SARS)*
	3. Hepatitis C	Shigellosis*
Campylobacter enteritis		Smallpox*
Chancroid		Streptococcal infections, Group A invasive*
Chickenpox (Varicella)	Herpes (neonatal) and HIV removed	Streptococcal infections, Group B neonatal
Chlamydia trachomatis infections		Syphilis
Cholera*		
Clostridium difficile* associated disease (CDAD) outbreaks in public hospitals	Influenza	
Creutzfeldt-Jakob Disease, all types		Tetanus
Cryptosporidiosis*	Lassa Fever*	Trichinosis
Cyclosporiasis*	Legionellosis*	Tuberculosis, active and latent
Diphtheria*	Leprosy	Tularemia*
	Listeriosis*	Typhoid Fever*
	Lyme Disease	
Encephalitis*, including:		Verotoxin-producing E. coli infection* indicator conditions, including Hemolytic Uremic Syndrome (HUS)*
1. Primary, viral*		
2. Post-infectious	Malaria	
3. Vaccine-related	Measles*	
4. Subacute sclerosing panencephalitis	Meningitis, acute*:	West Nile Virus illness*, including:
5. Unspecified	1. Bacterial*	1. West Nile fever*
	2. Viral*	2. West Nile neurological manifestations *
	3. Other*	
Food poisoning, all causes*	Meningococcal disease, invasive*	Yellow Fever*
	Mumps	Yersiniosis
Gastroenteritis, institutional outbreaks*		
Giardiasis, except asymptomatic cases*	Ophthalmia neonatorum	
Gonorrhea		
	Paralytic shellfish poisoning	
	Paratyphoid fever*	
	Pertussis (whooping cough)	
	Plague*	
	Pneumococcal disease, invasive	
	Poliomyelitis, acute*	
	Psittacosis/Ornithosis	

Other Reportable Conditions

- in addition to reporting diseases, physicians have a legal responsibility to report certain conditions. The list below highlights some reportable conditions for Ontario, but is not exhaustive. See your jurisdiction's regulatory body for the full list

Child Abuse – to local Children's Aid Society (CAS)

- all child abuse and neglect where reasonable grounds to suspect exist (including physical harm, emotional harm, sexual harm, and neglect)
- duty to report is ongoing: if additional reasonable grounds are suspect, a further report to CAS is necessary

Unfit to Drive – to provincial Ministry of Transportation

- all patients with a medical condition (e.g. dementia, untreated epilepsy) that may impede their driving ability
- if a physician does not report and the driver gets into an accident, the physician may be held liable

Unfit to Fly – to federal Ministry of Transportation

- all patients believed to be flight crew members or air traffic controller with a medical or optometric condition that is likely to constitute a hazard to aviation safety

Gunshots Wounds – to local police service

- all patients with a gunshot or stab wounds
- self-inflicted knife wounds are not reportable

Psychiatric Assessment

History

Identifying Data

- necessary: name, age, sex/gender, marital status, occupation/source of financial support, place/type of residency
- adjunct: makeup of household, education, ethnicity, nationality, immigration history (if applicable), religion, referral source, known or unknown to treatment team

Reliability of Patient as a Historian

- indicate if, and for what content; utilize collateral source (e.g. parent, teacher) if patient unable/unwilling to be interviewed

Chief Complaint

- in patient's own words, duration

History of Present Illness

- reason for seeking help (that day), current symptoms (onset, duration and course), stressors, supports, functional status, relevant associated symptoms (pertinent positives and negatives)
- current medication use, doses, and adherence
- safety screen: endangering self or others, dependents at home (e.g. children, pets), ability to drive safely, ability to care for self (e.g. eating, hygiene, taking medications)

Psychiatric Functional Inquiry

- mood: depression, mania
- anxiety: worries, panic attacks, phobias, history of trauma
- obsessive-compulsive: obsessions, compulsions
- psychosis: hallucinations, delusions
- risk assessment: suicidal ideation, plan, intent, history of attempts (*see Suicide, PS4*)
- organic: EtOH/drug use or withdrawal, illness, dementia

Past Psychiatric History

- all previous psychiatric diagnoses, psychiatric contacts, treatments (pharmacological and non-pharmacological), and hospitalizations
- include past suicide attempts, substance use/abuse, and problems/encounters with the legal system

Past Medical/Surgical History

- all medical, surgical, neurological (e.g. head trauma, seizures), and psychosomatic illnesses
- current medications, allergies

Family Psychiatric/Medical History

- family members: ages, occupations, personalities, medical or genetic illnesses and treatments, relationships with parents/siblings
- family psychiatric history: any past or current psychiatric illnesses and hospitalizations, suicide, substance abuse

Past Personal/Developmental History (as relevant)

- prenatal and perinatal history (desired vs. unwanted pregnancy, maternal and fetal health, domestic violence, maternal substance use and exposures, complications of pregnancy/delivery)
- early childhood to age three (developmental milestones, activity/attention level, family stability, attachment figures)
- middle childhood to age 11 (school performance, peer relationships, fire-setting, stealing, incontinence)
- late childhood to adolescence (drugs/alcohol, legal problems, peer and family relationships)
- history of physical or sexual abuse
- adulthood (education, occupations, relationships)
- personality before current illness, recent changes in personality
- psychosexual history (puberty, first sexual encounter, romantic relationships, gender roles, sexual dysfunction)

Screening Questions for Major Psychiatric Disorders

- Have you been feeling down, depressed or hopeless?
- Do you feel anxious or worry about things?
- Has there been a time in your life where you have felt euphoric, extremely talkative, had a lot of energy, and a decreased need for sleep?
- Do you see or hear things that you think other people cannot?
- Have you ever thought of harming yourself or committing suicide?

Psychiatric Functional Inquiry

MOAPS

Mood

Organic (e.g. substances and organic disease)

Anxiety

Psychosis

Safety

Always Remember to Ask About Abuse
See *Family Medicine, FM26*

Mental Status Exam

General Appearance

- posture, gait, grooming, hygiene, manner of dress, body habitus, facial expression, chronological vs. apparent age, relaxed or in distress

Behaviour

- psychomotor activity (agitation, retardation), abnormal movements or lack thereof (tremors, akathisia, tardive dyskinesia, paralysis), attention level and eye contact, attitude toward examiner (ability to interact, level of cooperation)

Speech

- rate (e.g. pressured, slowed), rhythm/fluency, volume, tone, articulation, quantity, spontaneity

Mood and Affect

- mood: subjective emotional state (in patient's own words)
- affect: objective emotional state inferred from emotional responses to stimuli; described in terms of
 - quality (euthymic, depressed, elevated, anxious, irritable)
 - range (full, restricted, flat, blunted)
 - stability (fixed, labile)
 - mood congruence (inferred by comparing the patient's subjective mood with their affect)
 - appropriateness to thought content
- some clinicians use 0-10 scales when rating mood to help get a subjective norm for each patient that can help establish changes over time and with treatment

Thought Process/Form

- coherence (coherent, incoherent)
- logic (logical, illogical)
- stream
 - goal-directed: clearly answers questions in a linear, organized, logical fashion
 - circumstantial: speech that is indirect and delayed in reaching its goal; eventually comes back to the point
 - tangential: speech is oblique or irrelevant; does not come back to the original point
 - loosening of associations/derailment: illogical shifting between topics
 - flight of ideas: quickly skipping from one idea to another where the ideas are marginally connected, usually associated with mania
 - word salad: jumble of words lacking meaning or logical coherence
- perseveration: repetition of the same verbal or motor response to stimuli
- echolalia: repetition of phrases or words spoken by someone else
- thought blocking: sudden cessation of flow of thought and speech
- clang associations: speech based on sound such as rhyming or punning
- neologism: use of novel words or of existing words in a novel fashion

Thought Content

- suicidal ideation/homicidal ideation
 - frequency and pervasiveness of thoughts, formulation of plan, means to plan, intent, active vs. passive, protective factors
- preoccupations, ruminations: reflections/thoughts at length, not fixed or false
- obsession: recurrent and persistent thought, impulse, or image which is intrusive or inappropriate and unwanted
 - cannot be stopped by logic or reason
 - causes marked anxiety and distress
 - common themes: contamination, orderliness, sexual, pathological doubt/worry/guilt
- magical thinking (e.g. superstition, belief that thinking something will make it happen), normal in children and certain cultures
- ideas of reference: similar to delusion of reference, but less fixed (the reality of the belief is questioned)
- overvalued ideas: unusual/odd beliefs that are not of delusional proportions
- first rank symptoms of schizophrenia: thought insertion/withdrawal/broadcasting
- delusion: a fixed false belief that is out of keeping with a person's cultural or religious background and is firmly held despite incontrovertible proof to the contrary

Perception

- hallucination: sensory perception in the absence of external stimuli that is similar in quality to a true perception
 - auditory (most common), visual, gustatory, olfactory, tactile
- illusion: misperception of a real external stimulus (such as mistaking a coat on a rack as a person late at night)
- depersonalization: change in self-awareness such that the person feels unreal, distant, or detached from his or her body, and/or unable to feel emotion
- derealization: feeling that the world/outer environment is unreal

Mental Status Exam

ASEPTIC

- Appearance and behaviour
- Speech
- Emotion (mood and affect)
- Perception
- Thought content and process
- Insight and judgment
- Cognition

The MSE is analogous to the physical exam. It focuses on current signs, affect, behaviour, and cognition

Spectrum of Affect

Full > Restricted > Blunted > Flat

There is poor correlation between clinical impression of suicide risk and frequency of attempts

Cognitive Assessment

- Use MMSE to assess
 - Orientation (time and place)
 - Memory (immediate and delayed recall)
 - Attention and concentration
 - Language (comprehension, reading, writing, repetition, naming)
 - Spatial ability (intersecting pentagons)
- Gross screen for cognitive dysfunction: Total score is out of 30; <26 abnormal, 20-26 mild, 10-19 moderate, <10 severe

The key to differentiating obsessions and delusions is that obsessions are usually ego dystonic, meaning unwanted and not fitting in with a person's goals and self-image, while delusions are ego syntonic

Delusions

- Persecutory: belief that others are trying to cause harm to you
- Reference: interpreting publicly known events/celebrities as having direct reference to you
- Erotomania: belief that another is in love with you
- Grandiose: belief that he or she has special powers, talents or abilities
- Religious: belief of receiving instructions/powers from a higher being; of being a higher being
- Somatic: belief that you have a physical disorder/defect
- Nihilistic: belief that things do not exist; a sense that everything is unreal

Cognition

- level of consciousness (alert, reduced, obtunded)
- orientation: time, place, person
- memory: immediate, recent, remote
- global evaluation of intellect (below average, average, above average, in keeping with person's education)
- intellectual functions: attention, concentration, calculation, abstraction (proverb interpretation, similarities test), language, communication
- MMSE/MOCA useful as standard screening assessments of cognition

Insight

- patient's ability to realize that he or she has a physical or mental illness and to understand its implications (none, limited, partial, full)

Judgment

- patient's ability to understand relationships between facts and draw conclusions that determine one's actions

Assessing Insight and Judgment

Insight

- Do you think that you have a mental illness?
- Why are you taking this medication?
- Why are you in the hospital?

Judgment

- Can be observed from collected history and patient's appearance and actions
- Is he/she dressed appropriately for the weather?
 - Is he/she acting appropriately in the given situation?
 - Is he/she taking care of self and/or dependents?

Assessment and Plan

Historical Multiaxial Model

- since DSM-5, this model is no longer used for psychiatric diagnosis. Instead, relevant psychiatric and medical diagnoses are simply listed. Nevertheless, we offer it here as a possible framework for psychiatric patient assessment, as many physicians still employ it

Multiaxial Assessment

- Axis I: differential diagnosis of DSM-5 clinical disorders
- Axis II: personality disorders, developmental disability
- Axis III: general medical conditions potentially relevant to understanding/management of the mental disorder
- Axis IV: psychosocial and environmental issues
- Axis V: Global Assessment of Functioning (GAF, 0 to 100) incorporating effects of axes I to IV

After History and MSE, the assessment and plan is recorded

Assessment/Problem Formulation

- identify predominant symptom cluster (mood, anxiety, psychosis, organic) causing the most distress/interference, persist when other symptom categories not present (e.g. psychosis in the absence of mood symptoms)
- dominating symptoms will direct differential
- consider current issues as they relate to an individual's factors in three domains: biological, psychological, and social
- for each category: predisposing, precipitating, perpetuating, and protecting factors are considered

Approach to Management

- consider short-term and long-term, and three types: biological (e.g. pharmacotherapy), psychological (e.g. CBT), and social (e.g. support group)

Always rule out substance use and organic causes before considering psychiatric causes

Suicide

Importance

- must be screened for in every encounter; part of risk assessment along with violent/homicidal ideation

Approach

- ask every patient – e.g. “Have you had any thoughts of wanting to harm or kill yourself?”
- classify ideation
 - passive ideation: would rather not be alive but has no active plan for suicide
 - ♦ e.g. “I'd rather not wake up” or “I would not mind if a car hit me”
 - active ideation
 - ♦ e.g. “I think about killing myself”
- assess risk
 - plan: “Do you have a plan as to how you would end your life?”
 - intent: “Do you think you would actually carry out this plan?” “If not, why not?”
 - past attempts: highest risk if previous attempt in past year
 - ♦ ask about lethality, outcome, medical intervention
- assess suicidal ideation
 - onset and frequency of thoughts: “When did this start?” or “How often do you have these thoughts?”
 - control over suicidal ideation: “How do you cope when you have these thoughts?” “Could you call someone for help?”
 - intention: “Do you want to end your life?” or “Do you wish to kill yourself?”
 - intended lethality: “What do you think would happen if you actually took those pills?”
 - access to means: “How will you get a gun?” or “Which bridge do you think you would go to?”
 - time and place: “Have you picked a date and place? Is it in an isolated location?”
 - provocative factors: “What makes you feel worse (e.g. being alone)?”

- protective factors: "What keeps you alive (e.g. friends, family, pets, faith, therapist)?"
- final arrangements: "Have you written a suicide note? Made a will? Given away your belongings?"
- practiced suicide or aborted attempts: "Have you ever put the gun to your head?" "Held the medications in your hand?" "Stood at the bridge?"
- ambivalence: "I wonder if there is a part of you that wants to live, given that you came here for help?"

Assessment of Suicide Attempt

- setting (isolated vs. others present/chance of discovery)
- planned vs. impulsive attempt, triggers/stressors
- substance use/intoxication
- medical attention (brought in by another person vs. brought in by self to ED)
- time lag from suicide attempt to ED arrival
- expectation of lethality, dying
- reaction to survival (guilt/remorse vs. disappointment/self-blame)

Epidemiology

- attempted:completed = 20:1
- M:F = 1:4 for attempts, 3:1 for completed

Risk Factors

- epidemiologic factors
 - age: increases after age 14, second most common cause of death for ages 15-24, highest rates of completion in persons >65 yr
 - sex: male
 - race/ethnic background: white or Native Canadians
 - marital status: widowed/divorced
 - living situation: alone; no children <18 yr old in the household
 - other: stressful life events, access to firearms
- psychiatric disorders
 - mood disorders (15% lifetime risk in depression; higher in bipolar)
 - anxiety disorders (especially panic disorder)
 - schizophrenia (10-15% risk)
 - substance abuse (especially alcohol – 15% lifetime risk)
 - eating disorders (5% lifetime risk)
 - adjustment disorder
 - conduct disorder
 - personality disorders (borderline, antisocial)
- past history
 - prior suicide attempt
 - family history of suicide attempt/completion

Clinical Presentation

- symptoms associated with suicide
 - hopelessness
 - anhedonia
 - insomnia
 - severe anxiety
 - impaired concentration
 - psychomotor agitation
 - panic attacks

Management

- proper documentation of the clinical encounter and rationale for management is essential
- higher risk (hospitalization needs to be strongly considered)
 - patients with a plan and intention to act on the plan, access to lethal means, recent social stressors, and symptoms suggestive of a psychiatric disorder
 - do not leave patient alone; remove potentially dangerous objects from room
 - if patient refuses to be hospitalized, complete form for involuntary admission (Form 1)
- lower risk
 - patients who are not actively suicidal, with no plan or access to lethal means
 - discuss protective factors and supports in their life, remind them of what they live for, promote survival skills that helped them through previous suicide attempts
 - make a safety plan that could include an agreement that they will:
 - ◆ not harm themselves
 - ◆ avoid alcohol, drugs, and situations that may trigger suicidal thoughts
 - ◆ follow-up with you at a designated time
 - ◆ contact a health care worker, call a crisis line, or go to an emergency department if they feel unsafe or if their suicidal feelings return or intensify
- depression: consider hospitalization if symptoms severe or if psychotic features are present; otherwise outpatient treatment with good supports and SSRIs/SNRIs
- alcohol-related: usually resolves with abstinence for a few days; if not, suspect depression
- personality disorders: crisis intervention, may or may not hospitalize
- schizophrenia/psychosis: hospitalization might be necessary
- parasuicide/self-mutilation: long-term psychotherapy with brief crisis intervention when necessary

Suicide Risk Factors

SAD PERSONS

- Sex (male)
- Age >60 yr old
- Depression
- Previous attempts
- Ethanol abuse
- Rational thinking loss (delusions, hallucinations, hopelessness)
- Suicide in family
- Organized plan
- No spouse (no support systems)
- Serious illness, intractable pain

Suicidal Ideation Assessment

- Asking patients about suicide will not give them the idea or the incentive to commit suicide
- The best predictor of completed suicide is a history of attempted suicide
- The most common psychiatric disorders associated with completed suicide are mood disorders and alcohol abuse

Psychotic Disorders

Definition

- characterized by a significant impairment in reality testing
- delusions or hallucinations (with/without insight into their pathological nature)
- behaving in a disorganized way so that it is reasonable to infer that reality testing is disturbed

Differential Diagnosis of Psychosis

Approach

- differentiate among psychotic disorders and distinguish them from other primary diagnoses with psychotic features
- consider symptoms, persistence, and time
- symptoms: what symptoms exist? The primary diagnosis needs full criteria to be met
 - mood: depressive episodes with psychotic features, manic episodes with psychotic features
 - psychotic: consider symptoms in Criterion A of schizophrenia, such as delusions, hallucinations, disorganized speech, grossly disorganized/catatonic behaviour, negative symptoms (i.e. diminished emotional expression or avolition)
- persistence: is there a time when certain symptom clusters are present without other clusters?
 - e.g. if there is a period of time with mood symptoms but not psychotic symptoms, consider mood disorder
 - e.g. if two weeks where psychotic symptoms persist in the absence of mood symptoms, consider schizoaffective disorder
- time: how long have the symptoms been present?

Table 1. Differentiating Psychotic Disorders

Disorder	Psychotic Symptoms	Duration
Brief Psychotic Disorder	≥1 positive symptoms of criterion A	<1 mo
Schizophreniform Disorder	Criterion A	1-6 mo
Schizophrenia	Criterion A	>6 mo
Schizoaffective Disorder	Criterion A + major mood episode, but ≥2 wk psychotic without mood symptoms	>1 mo
Delusional Disorder	Non-bizarre delusions, hallucinations	>1 mo
2° to Substance Intoxication/Withdrawal	Delusions or hallucinations	During intoxication/withdrawal, not >1 mo without use
2° to Mood Disorder	Mood symptoms dominant + delusions/hallucinations (mood congruent)	Psychosis may be present for the duration of the mood episode

Schizophrenia

DSM-5 Diagnostic Criteria for Schizophrenia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. two (or more) of the following, each present for a significant portion of time during a 1 mo period (or less if successfully treated). At least one of these must be (1), (2), or (3)
1. delusions
 2. hallucinations
 3. disorganized speech (e.g. frequent derailment or incoherence)
 4. grossly disorganized or catatonic behaviour
 5. negative symptoms (i.e. diminished emotional expression or avolition)
- B. decreased level of function: for a significant portion of time since onset, one or more major areas affected (e.g. work, interpersonal relations, self-care) is markedly decreased (or if childhood/adolescent onset, failure to achieve expected level)
- C. at least 6 mo of continuous signs of the disturbance. Must include at least 1 mo of symptoms (or less if successfully treated) that meet Criterion A (i.e. active-phase symptoms) and may include periods of prodromal or residual symptoms, during which, disturbance may manifest by only negative symptoms or by two or more Criterion A symptoms present in an attenuated form (e.g. odd beliefs, unusual perceptual experiences)
- D. rule out schizoaffective disorder and depressive or bipolar disorder with psychotic features because either 1) no major depressive or manic episodes have occurred concurrently with the active-phase symptoms, or 2) if mood episodes have occurred during active-phase symptoms, they have been present for a minority of the total duration of the active and residual periods of the illness
- E. rule out other causes: GMC, substances (e.g. drug of abuse, medication)
- F. if history of autism spectrum disorder or communication disorder of childhood onset, the additional diagnosis of schizophrenia is made only if prominent delusions or hallucinations are also present for at least 1 mo (or less if successfully treated)
- **specifiers:** type of episode (e.g. first episode, multiple episodes, continuous), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis (in acute episode, in partial remission, in full remission)

Delusions: fixed, false beliefs
Hallucinations: perceptual experiences without an external stimulus

Duration of Time Differentiates the following 3 Psychotic Disorders

Brief Psychotic Disorder <1 month	Schizophreniform Disorder 1-6 months	Schizophrenia >6 months
		→

Figure 1. Differentiating psychotic disorders with duration

Ddx for psychosis

- Primary psychotic disorders: schizophrenia, schizophreniform, brief psychotic, schizoaffective, delusional disorder
- Mood disorders: depression with psychotic features, bipolar disorder (manic or depressive episode with psychotic features)
- Personality disorders: schizotypal, schizoid, borderline, paranoid, obsessive-compulsive
- General medical conditions: tumour, head trauma, dementia, delirium, metabolic, infection, stroke, temporal lobe epilepsy
- Substance-induced psychosis: intoxication or withdrawal, prescribed medications, toxins

Management of Acute Psychosis and Mania

- Ensure safety of self, patient, and other patients
- Have an exit strategy
- Decrease stimulation
- Assume a non-threatening stance
- IM medications (benzodiazepine + antipsychotic) often needed as patient may refuse oral medication
- Physical restraints may be necessary
- Do not use antidepressants or stimulants

Disorganized Behaviours in Schizophrenia

- Catatonic stupor: fully conscious, but immobile, mute, and unresponsive
- Catatonic excitement: uncontrolled and aimless motor activity, maintaining bizarre positions for a long time
- Stereotypy: repeated but non-goal-directed movement (e.g. rocking)
- Mannerisms: goal-directed activities that are odd or out of context (e.g. grimacing)
- Echopraxia: imitates movements and gestures of others
- Automatic obedience: carries out simple commands in robot-like fashion
- Negativism: refuses to cooperate with simple requests for no apparent reason
- Inappropriate affect, neglect of self-care, other odd behaviours (random shouting)

Epidemiology

- prevalence: 0.3-0.7%, M:F = 1:1
- mean age of onset: females late-20s; males early- to mid-20s
- suicide risk: 10% die by suicide, 30% attempt suicide

Etiology

- multifactorial: disorder is a result of interaction between both biological and environmental factors
 - genetic: 40% concordance in monozygotic (MZ) twins; 46% if both parents have schizophrenia; 10% of dizygotic (DZ) twins, siblings, children affected; vulnerable genes include Disrupted-in-Schizophrenia 1 (DISC1); neuregulin 1 (NRG 1); dystrobrevin binding protein / dysbindin (DTNBP1); catechol-O-methyltransferase (COMT); d-amino acid oxidase activator (DAOA); metabotropic glutamate receptor 3 (GRM3); and brain-derived neurotrophic factor (BDNF)
 - neurochemistry ("dopamine hypothesis"): excess activity in the mesolimbic dopamine pathway may mediate the positive symptoms of psychosis, while decreased dopamine in the prefrontal cortex may mediate negative and cognitive symptoms. GABA, glutamate, and ACh dysfunction are also thought to be involved
 - neuroanatomy: decreased frontal lobe function; asymmetric temporal/limbic function; decreased basal ganglia function; subtle changes in thalamus, cortex, corpus callosum, and ventricles; cytoarchitectural abnormalities
 - neuroendocrinology: abnormal growth hormone, prolactin, cortisol, and ACTH
 - neuropsychology: global defects seen in attention, language, and memory suggest disrupted connectivity of neural networks
 - environmental: indirect evidence of cannabis use, geographical variance, winter season of birth, obstetrical complications, and prenatal viral exposure

Pathophysiology

- neurodegenerative theory: natural history may be a rapid or gradual decline in function and ability to communicate
 - glutamate system may mediate progressive degeneration by excitotoxic mechanism which leads to production of free radicals
- neurodevelopmental theory: abnormal development of the brain from prenatal life
 - neurons fail to migrate correctly, make inappropriate connections, and apoptosis in later life

Comorbidity

- substance-related disorders
- anxiety disorders
- reduced life expectancy secondary to medical comorbidities (e.g. obesity, diabetes, metabolic syndrome, CV/pulmonary disease)

Management of Schizophrenia

- biological / somatic
 - acute treatment and maintenance: antipsychotics (haloperidol, risperidone, olanzapine, paliperidone; clozapine if refractory); often regimens of IM q2-4 wk used in severe cases to ensure adherence
 - adjunctive: ± mood stabilizers (for aggression/impulsiveness - lithium, valproate, carbamazepine) ± anxiolytics ± ECT
 - treat for at least 1-2 years after the first episode, at least 5 years after multiple episodes (relapse causes severe deterioration)
- psychosocial
 - psychotherapy (individual, family, group), supportive, CBT (see Table 14, PS41)
 - ACT (Assertive Community Treatment): mobile mental health teams that provide individualized treatment in the community and help patients with medication adherence, basic living skills, social support, job placements, resources
 - social skills training, employment programs, disability benefits
 - housing (group home, boarding home, transitional home)

Course and Prognosis

- majority of individuals display some type of prodromal phase
- course is variable: some individuals have exacerbations and remissions while others remain chronically ill; accurate prediction of the long-term outcome is not possible
- negative symptoms may be prominent early in the illness and may become more prominent and more disabling later on; positive symptoms appear and typically diminish with treatment
- over time: 1/3 improve, 1/3 remain the same, 1/3 worsen

Relationship Between Duration of Untreated Psychosis (DUP) and Outcome in First-Episode Schizophrenia

Am J Psychiatry 2005;162:1785-1804

Purpose: To review the association between DUP and symptom severity at first treatment contact, and between DUP and treatment outcomes.

Methods: Critical review and meta-analysis of studies involving patients with non-affective psychotic disorders at or close to first treatment.

Results: 43 studies with 4,177 patients were included. Shorter DUP was associated with greater response to antipsychotic treatment, as measured by global psychopathology, positive symptoms, negative symptoms, and functional outcomes. At the time of treatment initiation, longer DUP was associated with the severity of negative symptoms but not with the severity of positive symptoms, global psychopathology, or neurocognitive function.

Conclusions: DUP may be a potentially modifiable prognostic factor.

Good Prognostic Factors

- Acute onset
- Shorter duration of prodrome
- Female gender
- Good cognitive functioning
- Good premorbid functioning
- No family history
- Presence of affective symptoms
- Absence of structural brain abnormalities
- Good response to drugs
- Good support system

Schizophreniform Disorder

Diagnosis

Adopted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- criteria A, D, and E of schizophrenia are met; an episode of the disorder lasts for at least 1 mo but less than 6 mo
- if the symptoms have extended past 6 mo the diagnosis becomes schizophrenia
- **specifiers:** with/without good prognostic features (e.g. acute onset, confusion, good premorbid functioning, absence of blunt/flat affect), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis

Treatment

- similar to acute schizophrenia

Prognosis

- better than schizophrenia; begins and ends more abruptly; good pre- and post-morbid function

Brief Psychotic Disorder

Diagnosis

Adopted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- criteria A1-A4, D, and E of schizophrenia are met; an episode of the disorder lasts for at least 1 d, but less than 1 mo with eventual full return to premorbid level of functioning
- **specifiers:** with/without marked stressors, with postpartum onset, with catatonia, current severity
- can occur after a stressful event or postpartum (*see Postpartum Mood Disorders, PS12*)

Treatment

- secure environment, antipsychotics, anxiolytics

Prognosis

- good, self-limiting, should return to pre-morbid function within 1 mo

Schizoaffective Disorder

DSM-5 Diagnostic Criteria for Schizoaffective Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- concurrent psychosis (criterion A of schizophrenia) and major mood episode - uninterrupted period of illness
 - delusions or hallucinations for 2 or more wk in the absence of a major mood episode during the lifetime duration of the illness
 - major mood episode symptoms are present for the majority of the total duration of the active and residual periods of the illness
 - the disturbance is not attributable to the effects of a substance or another medical condition
- **specifiers:** bipolar type, depressive type, with catatonia, type of episode, severity

Epidemiology

- one-third as prevalent as schizophrenia; schizoaffective disorder bipolar type more common in young adults, schizoaffective disorder depressive type more common in older adults
- depressive symptoms correlated with higher suicide risk

Treatment

- antipsychotics, mood stabilizers, antidepressants

Prognosis

- between that of schizophrenia and of mood disorder

Non-bizarre delusions involve situations that could occur in real life (e.g. being followed, poisoned, loved at a distance)

Delusional Disorder

DSM-5 Diagnostic Criteria for Delusional Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- the presence of one (or more) delusions with a duration of 1 mo or longer
 - criterion A for schizophrenia has never been met
- Note:** hallucinations, if present, are not prominent and are related to the delusional theme
- apart from the impact of the delusion(s) or its ramifications, functioning is not markedly impaired, and behaviour is not obviously bizarre or odd
 - if manic or major depressive episodes have occurred, these have been brief relative to the duration of the delusional periods
 - the disturbance is not attributable to the physiological effects of a substance or another medical condition and is not better explained by another mental disorder
- **subtypes:** erotomanic, grandiose, jealous, persecutory, somatic, mixed, unspecified
 - further specify: bizarre content, type of episode (e.g. first episode, multiple episode), severity

Treatment

- psychotherapy, antipsychotics, antidepressants

Prognosis

- chronic, unremitting course but high level of functioning; a portion will progress to schizophrenia

Mood Disorders

Definitions

- accurate diagnosis of a mood disorder requires a careful past medical and psychiatric history to detect past mood episodes and to rule out whether these episodes were secondary to substance use, a medical condition, a loss, etc
- mood episodes represent a combination of symptoms comprising a predominant mood state that is abnormal in quality or duration (e.g. major depressive, manic, mixed, hypomanic). DSM-5 Criteria for mood episodes are listed below
- types of mood disorders include
 - depressive (major depressive disorder, persistent depressive disorder)
 - bipolar (bipolar I/II disorder, cyclothymia)
 - secondary to general medical condition, substances, medications, other psychiatric issue

Medical Workup of Mood Disorder

- routine screening: physical exam, CBC, thyroid function test, extended electrolytes, urinalysis, drug screen, medications list
- additional screening: neurological consultation, chest X-ray, ECG, CT head

Mood Episodes

DSM-5 Diagnostic Criteria for Major Depressive Episode

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. ≥ 5 of the following symptoms have been present during the same 2 wk period and represent a change from previous functioning; at least one of the symptoms is either 1) depressed mood or 2) loss of interest or pleasure (anhedonia)

Note: do not include symptoms that are clearly attributable to another medical condition

- depressed mood most of the day, nearly every day, as indicated by either subjective report or observation made by others
 - markedly diminished interest or pleasure in all, or almost all, activities most of the day, nearly every day
 - significant and unintentional weight loss/weight gain, or decrease/increase in appetite nearly every day
 - insomnia or hypersomnia nearly every day
 - psychomotor agitation or retardation nearly every day
 - fatigue or loss of energy nearly every day
 - feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick)
 - diminished ability to think or concentrate, or indecisiveness, nearly every day
 - recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide
- B. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- C. the episode is not attributable to the direct physiological effects of a substance or a GMC

DSM-5 Criteria for Manic Episode

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. a distinct period of abnormally and persistently elevated, expansive, or irritable mood, and abnormally and persistently increased goal-directed activity or energy, lasting ≥ 1 wk and present most of the day, nearly every day (or any duration if hospitalization is necessary)
- B. during the period of mood disturbance and increased energy or activity, ≥ 3 of the following symptoms have persisted (4 if the mood is only irritable) have been present to a significant degree and represent a noticeable change from usual behaviour
- inflated self-esteem or grandiosity
 - decreased need for sleep (e.g. feels rested after only 3 h of sleep)
 - more talkative than usual or pressure to keep talking
 - flight of ideas or subjective experience that thoughts are racing
 - distractibility (i.e. attention too easily drawn to unimportant or irrelevant external stimuli)
 - increase in goal-directed activity (either socially, at work or school, or sexually) or psychomotor agitation
 - excessive involvement in pleasurable activities that have a high potential for painful consequences (e.g. engaging in unrestrained shopping sprees, sexual indiscretions, or foolish business investments)
- C. the mood disturbance is sufficiently severe to cause marked impairment in social/occupational functioning or to necessitate hospitalization to prevent harm to self or others, or there are psychotic features
- D. the episode is not attributable to the physiological effects of a substance or another medical condition

**Criteria for Depression (≥ 5)****MSIGECAPS**

Mood: depressed
 Sleep: increased/decreased
 Interest: decreased
 Guilt
 Energy: decreased
 Concentration: decreased
 Appetite: increased/decreased
 Psychomotor: agitation/retardation
 Suicidal ideation

**Criteria for Mania (≥ 3)****GST PAID**

Grandiosity
 Sleep (decreased need)
 Talkative
 Pleasurable activities, Painful consequences
 Activity
 Ideas (flight of)
 Distractible

Note: A full manic episode that emerges during antidepressant treatment but persists at a fully syndromal level beyond the physiological effect of that treatment is sufficient evidence for a manic episode, and therefore, a bipolar I diagnosis

Note: Criteria A-D constitute a manic episode. At least one lifetime manic episode is required for the diagnosis of bipolar I disorder

Hypomanic Episode

- criterion A and B of a manic episode is met, but duration is ≥ 4 d
- episode associated with an uncharacteristic change in functioning that is observable by others but not severe enough to cause marked impairment in social or occupational functioning or to necessitate hospitalization
- absence of psychotic features (if these are present the episode is, by definition, manic)

Mixed Features

- an episode specifier in bipolar or depression that indicates the presence of both depressive and manic symptoms concurrently, classified by the disorder and primary mood episode component (e.g. bipolar disorder, current episode manic, with mixed features)
- clinical importance due to increased suicide risk
- if found in patient diagnosed with major depression, high index of suspicion for bipolar disorder
- while meeting the full criteria for a major depressive episode, the patient has on most days ≥ 3 of criteria B for a manic episode
- while meeting the full criteria for a manic/hypomanic episode, the patient has on most days ≥ 3 of criteria A for a depressive episode (the following criterion A cannot count: psychomotor agitation, insomnia, difficulties concentrating, weight changes)

Depressive Disorders

MAJOR DEPRESSIVE DISORDER

DSM-5 Diagnostic Criteria for Major Depressive Disorder (MDD)

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- presence of a MDE
 - the MDE is not better accounted for by schizoaffective disorder and is not superimposed on schizophrenia, schizophreniform disorder, delusional disorder, or psychotic disorder NOS
 - there has never been a manic episode or a hypomanic episode
- Note:** This exclusion does not apply if all of the manic-like, or hypomanic-like episodes are substance or treatment-induced or are due to the direct physiological effects of another medical condition
- **specifiers:** with anxious distress, mixed features, melancholic features, atypical features, mood-congruent psychotic features, mood-incongruent psychotic features, catatonia, peripartum onset, seasonal pattern
 - single vs. recurrent is an episode descriptor that carries prognostic significance. Recurrent is classified as the patient having two or more distinct MDE episodes; to be considered separate the patient must have gone 2 consecutive months without meeting criteria

Epidemiology

- lifetime prevalence: 12%
- peak prevalence age 15-25 yr (M:F = 1:2)

Etiology

- biological
 - genetic: 65-75% MZ twins; 14-19% DZ twins, 2-4 fold increased risk in first-degree relatives
 - neurotransmitter dysfunction: decreased activity of 5-HT, NE, and DA at neuronal synapse; changes in GABA and glutamate; various changes detectable by fMRI
 - neuroendocrine dysfunction: abnormal HPA axis activity
 - neuroanatomy and neurophysiology: decreased hippocampal volume, increased size of ventricles; decreased REM latency and slow-wave sleep; increased REM length
 - immunologic: increased pro-inflammatory cytokines IL-6 and TNF
 - secondary to medical condition, medication, substance use disorder
- psychosocial
 - psychodynamic (e.g. low self-esteem, unconscious aggression towards self or loved ones, disordered attachment)
 - cognitive (e.g. distorted schemata, Beck's cognitive triad: negative views of the self, the world, and the future)
 - environmental factors (e.g. job loss, bereavement, history of abuse or neglect, early life adversity)
 - comorbid psychiatric diagnoses (e.g. anxiety, substance abuse, developmental disability, dementia, eating disorder)

Risk Factors

- sex: F>M, 2:1
- family history: depression, alcohol abuse, suicide attempt or completion
- childhood experiences: loss of parent before age 11, negative home environment (abuse, neglect)
- personality: neuroticism, insecure, dependent, obsessional
- recent stressors: illness, financial, legal, relational, academic
- lack of intimate, confiding relationships or social isolation
- low socioeconomic status

Antidepressants for Depression in Physical Medical Illness

Cochrane Database Syst Rev 2000;(4):CD001312

Purpose: To evaluate whether antidepressants are clinically effective and acceptable for treatment of depression in patients who also have a physical illness.

Methods: Systematic review of RCTs comparing any antidepressant drug as defined by the British National Formulary with placebo or no treatment, in patients aged 16 years and over who have been formally diagnosed with depression by any criterion, and have a specified physical disorder. Main outcome measures were number of individuals demonstrating improvement or recovery by the end of the trial, and number completing treatment (as a proxy for treatment acceptability).

Results: Eighteen studies with 838 patients having varied physical illnesses were included. Patients treated with antidepressants were significantly more likely to improve than those given placebo (13 studies, OR 0.37, 95% CI 0.27-0.51) or no treatment (1 study, OR 3.45, 11.1-1.10) (number needed to treat relative to placebo = 4.2, 3.2-6.4). Most antidepressants were associated with a small but significant increase in dropouts (OR 1.66, 1.14-2.40; NNH 9.8, 5.4-42.9). Among two studies evaluating impact on function and quality of life, drug was found to be better than no treatment for HIV patients, and drug was not significantly different than placebo in lung disease patients. Tricyclics appeared to be more effective than SSRIs but also more likely to produce dropouts, based on non-randomized comparisons between trials.

Conclusion: Antidepressants cause improvements in depression in patients with various physical diseases significantly more frequently than placebo or no treatment. Antidepressants were reasonably acceptable to patients. Tricyclics may be more effective than SSRIs but may also produce more dropouts. As such, antidepressants should at least be considered in those with concomitant physical illness and depression.

Depression in the Elderly

- affects about 15% of community residents >65 yr old; up to 50% in nursing homes
- high suicide risk due to social isolation, chronic medical illness, decreased independence
- suicide peak: males aged 80-90; females aged 50-65
- dysphoria may not be a reliable indicator of depression in those >85 yr
- often present with somatic complaints (e.g. changes in weight, sleep, energy) or anxiety symptoms
- may have prominent cognitive changes after onset of mood symptoms (dementia syndrome of depression)
- see [Table 3, PS21](#), for a comparison of delirium and dementia

Treatment

- lifestyle: increased aerobic exercise, mindfulness-based stress reduction, zinc supplementation
- biological: SSRIs, SNRIs, other antidepressants, somatic therapies (see [Pharmacotherapy, PS42](#), and [Somatic Therapies, PS49](#))
 - 1st line pharmacotherapy: sertraline, escitalopram, venlafaxine, mirtazapine
 - for partial or non-response, can change class or add augmenting agent (bupropion, quetiapine-XR, aripiprazole, lithium)
 - typical response to antidepressant treatment: physical symptoms improve at 2 wk, mood/cognition by 4 wk; if no improvement after 4 wk at a therapeutic dosage, alter regimen
 - ECT: currently fastest and most effective treatment for MDD. Consider in severe, psychotic or treatment-resistant cases
 - rTMS: early data support efficacy equivalent to ECT with good safety and tolerability
 - phototherapy: especially if seasonal component, shift work, sleep dysregulation
- psychological
 - individual therapy (interpersonal, CBT), family therapy, group therapy
- social: vocational rehabilitation, social skills training
- experimental: magnetic seizure therapy, deep brain stimulation, vagal nerve stimulation, ketamine

Prognosis

- one year after diagnosis of MDD without treatment: 40% of individuals still have symptoms that are sufficiently severe to meet criteria for MDD, 20% continue to have some symptoms that no longer meet criteria for MDD, 40% have no mood disorder

PERSISTENT DEPRESSIVE DISORDER

DSM-5 Diagnostic Criteria for Persistent Depressive Disorder

Note: in DSM-IV-TR this was referred to as Dysthymia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. depressed mood for most of the day, for more days than not, as indicated either by subjective account or observation by others, for ≥ 2 yr

Note: in children and adolescents, mood can be irritable and duration must be at least 1 yr

B. presence, while depressed, of ≥ 2 of the following:

- poor appetite or overeating
- insomnia or hypersomnia
- low energy or fatigue
- low self-esteem
- poor concentration or difficulty making decisions
- feelings of hopelessness

C. during the 2 yr period (1 yr for children or adolescents) of the disturbance, the person has never been without the symptoms in criteria A and B for more than 2 mo at a time

D. criteria for a major depressive disorder may be continuously present for 2 yr

E. there has never been a manic episode or a hypomanic episode, and criteria have never been met for cyclothymic disorder

F. the disturbance is not better explained by a persistent schizoaffective disorder, schizophrenia, delusional disorder, or other specified or unspecified schizophrenia spectrum and other psychotic disorder

G. the symptoms are not due to the direct physiological effects of a substance or another medical condition

H. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

Epidemiology

- lifetime prevalence: 2-3%; M=F

Treatment

- psychological
 - traditionally, psychotherapy was the principal treatment for persistent depressive disorder; recent evidence suggests some benefit, but generally inferior to pharmacological treatment. Combinations of the two may be most efficacious
- biological
 - antidepressant therapy: SSRIs (e.g. sertraline, paroxetine), TCAs (e.g. imipramine) as an outpatient

St. John's Wort for Major Depression

Cochrane Database Syst Rev 2008;(4):CD000448

Purpose: To evaluate whether extracts of hypericum are more effective than placebo, and as effective as standard anti-depressants with fewer adverse effects, for the treatment of major depression.

Methods: Systematic review of double-blinded RCTs involving patient with major depression, comparing St. John's wort (hypericum extracts) with placebo or standard antidepressants. Main efficacy outcome was treatment response measured by a depression scale; mean safety outcome was the proportion of patients who dropped out due to adverse effects.

Results: Twenty-nine trials involving 5,489 patients were included. St John's wort was found to be more effective than placebo (response rate ratio (RRR) = 1.28, 95% CI 1.10-1.49), and similarly effective as tri- or tetracyclic antidepressants and selective serotonin reuptake inhibitors (RR = 1.02, 0.90-1.15; 1.00, 0.90-1.11, respectively). Less dropouts due to adverse effects were found with hypericum extracts relative to older antidepressants (odds ratio (OR) 0.24, 0.13-0.46) or SSRIs (OR 0.53, 0.34-0.83).

Conclusion: St. John's wort is superior to placebo in patients with major depression, similarly effective compared to antidepressants, and has fewer side-effects than standard anti-depressants.

Cognitive Therapy vs. Medications in the Treatment of Moderate to Severe Depression

Arch Gen Psychiatry 2005;62:409-416

Purpose: To compare the efficacy of antidepressant medications with cognitive therapy versus placebo in moderate to severe depression.

Methods: Outpatients with moderate to severe major depressive disorder (MDD), aged 18-70 years, were treated with 16 weeks of paroxetine with or without augmentation with lithium carbonate or desipramine hydrochloride versus cognitive behavioural therapy. Response up to 8 wk was controlled by pill placebo. The Hamilton Depression Rating scale was used to determine response to treatment.

Results: 240 patients were included, 60 assigned to the intervention arm and 60 assigned to placebo. At 8 wks, 50% (95%CI 41-59%) of patients on medication and 43% (31-56%) of patients on CBT had responded, in comparison to 25% (16-38%) of patients on pill placebo. There was no significant difference between medication and CBT. At 16 wk, 46% of patients on medication and 40% of patients on CBT achieved remission.

Conclusion: There is no difference in efficacy between CBT vs. paroxetine in the treatment of moderate to severe depression.

Postpartum Mood Disorders

Postpartum "Blues"

- transient period of mild depression, mood instability, anxiety, decreased concentration; considered to be normal changes in response to fluctuating hormonal levels, the stress of childbirth, and the increased responsibilities of motherhood
- occurs in 50-80% of mothers; begins 2-4 d postpartum, usually lasts 48 h, can last up to 10 d
- does not require psychotropic medication
- usually mild or absent: feelings of inadequacy, anhedonia, thoughts of harming baby, suicidal thoughts

MAJOR DEPRESSIVE DISORDER WITH PERIPARTUM ONSET (POSTPARTUM DEPRESSION)

Clinical Presentation

- MDD with onset during pregnancy or within 4 wk following delivery
- typically lasts 2-6 mo; residual symptoms can last up to 1 yr
- may present with psychosis (rare, 0.2%), usually associated with mania, but also with MDE
- severe symptoms include extreme disinterest in baby, suicidal and infanticidal ideation

Epidemiology

- occurs in 10% of mothers, risk of recurrence 50%

Risk Factors

- previous history of a mood disorder (postpartum or otherwise), family history of mood disorder
- psychosocial factors: stressful life events, unemployment, marital conflict, lack of social support, unwanted pregnancy, colicky or sick infant

Treatment

- psychotherapy (CBT or IPT)
- short-term safety of maternal SSRIs for breastfeeding infants established; long-term effects unknown
- if depression severe or psychotic symptoms present, consider ECT

Prognosis

- impact on child development: increased risk of cognitive delay, insecure attachment, behavioural disorders
- treatment of mother improves outcome for child at 8 mo through increased mother-child interaction

Selective Serotonin Reuptake Inhibitors in Pregnancy and Infant Outcomes

Paediatr Child Health 2011;16:562-563
Canadian Pediatric Society (CPS) clinical practice guideline recommendations: It is important to treat depression in pregnancy. There is no evidence that SSRIs increase the risk of major malformations. There is conflicting evidence concerning the association of paroxetine and cardiac malformations. SSRIs are not contraindicated while breast-feeding.

Bipolar Disorders

BIPOLAR I / BIPOLAR II DISORDER

Definition

- Bipolar I Disorder
 - disorder in which at least one manic episode has occurred
 - if manic symptoms lead to hospitalization, or if there are psychotic symptoms, the diagnosis is BP I
 - commonly accompanied by at least 1 MDE but not required for diagnosis
 - time spent in mood episodes: 53% asymptomatic, 32% depressed, 9% cycling/mixed, 6% hypo/manic
- Bipolar II Disorder
 - disorder in which there is at least 1 MDE, 1 hypomanic and no manic episodes
 - while hypomania is less severe than mania, Bipolar II is not a "milder" form of Bipolar I
 - time spent in mood episodes: 46% asymptomatic, 50% depressed, 1% cycling/mixed, 2% hypo/manic
 - Bipolar II is often missed due to the severity and chronicity of depressive episodes and low rates of spontaneous reporting and recognition of hypomanic episodes

Classification

- classification of bipolar disorder involves describing the disorder (I or II) and the current or most recent mood episode as either manic, hypomanic, or depressed
- specifiers:** with anxious distress, depressed with mixed features, hypo/manic with mixed features, melancholic features, atypical features, mood-congruent or -incongruent psychotic features, catatonia, peripartum onset, seasonal pattern, rapid cycling (4+ mood episodes in 1 yr)

Epidemiology

- lifetime prevalence: 1% BPI, 1.1% BPII, 2.4% Subthreshold BPD; M:F = 1:1
- age of onset: teens to 20s, usually MDE first, manic episode 6-10 years after, average age of first manic episode 32 yr

Risk Factors

- genetic: 60-65% of bipolar patients have family history of major mood disorders, especially bipolar disorders
- clinical features of MDE history favouring bipolar over unipolar diagnosis: early age of onset (<25 yr), increased number of MDEs, psychotic symptoms, postpartum onset, anxiety disorders (especially separation, panic), antidepressant failure due to early "poop out" or hypomanic symptoms, early impulsivity and aggression, substance abuse, cyclothymic temperament

Bipolar II is quite often missed and many patients are symptomatic for up to a decade before accurate diagnosis and treatment

Patients with bipolar disorder are at higher risk for suicide when they switch from mania to depression, especially as they become aware of consequences of their behaviour during the manic episode

Treatment

- **lifestyle:** psychoeducation regarding cycling nature of illness, ensure regular check ins, develop early warning system, “emergency plan” for manic episodes, promote stable routine (sleep, meals, exercise)
- **biological:** lithium, anticonvulsants, antipsychotics, ECT (if refractory); monotherapy with antidepressants should be avoided
 - mood stabilizers vary in their ability to “treat” (reduce symptoms acutely) or “stabilize” (prevent relapse and recurrence) manic and depressive symptoms; multi-agent therapy is common
 - treating mania: lithium, valproate, carbamazepine (2nd line), SGA, ECT, benzodiazepines (for acute agitation)
 - preventing mania: same as above but usually at lower dosages, minus benzodiazepines
 - treating depression: lithium, lurasidone, quetiapine, lamotrigine, antidepressants (only with mood stabilizer), ECT
 - preventing depression: same as above plus aripiprazole, valproate (note: quetiapine first line in treating bipolar II depression)
 - mixed episode or rapid cycling: multi-agent therapy, lithium or valproate + SGA (lurasidone, aripiprazole, olanzapine)
- **psychological:** supportive psychotherapy, CBT, IPT or interpersonal social rhythm therapy, family therapy
- **social:** vocational rehabilitation, consider leave of absence from school/work, assess capacity to manage finances, drug and EtOH cessation, sleep hygiene, social skills training, education and recruitment of family members

Course and Prognosis

- high suicide rate (15% mortality from suicide), especially in mixed states
- BP I and II are chronic conditions with a relapsing and remitting course featuring alternating manic and depressive episodes; depressive symptoms tend to occur more frequently and last longer than manic episodes
- can achieve high level of functioning between episodes
- may switch rapidly between depression and mania without any period of euthymia in between
- high recurrence rate for mania – 90% will have a subsequent episode in the next 5 yr
- long term follow-up of BP I – 15% well, 45% well with relapses, 30% partial remission, 10% chronically ill

CYCLOTHYMIA

Adapted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

Diagnosis

- presence of numerous periods of hypomanic and depressive symptoms (not meeting criteria for full hypomanic episode or MDE) for ≥ 2 yr; never without symptoms for >2 mo
- never have met criteria for MDE, manic or hypomanic episodes
 - symptoms not better explained by any psychotic disorder (including schizoaffective, schizophrenia, schizophreniform, delusional disorder, or other specified/unspecified)
- symptoms are not due to the direct physiological effects of a substance or GMC
- symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

Treatment

- similar to Bipolar I: mood stabilizer \pm psychotherapy, avoid antidepressant monotherapy, treat any comorbid substance use disorder

Lithium is among few agents with proven efficacy in preventing suicide attempts and completions

Monotherapy with antidepressants should be avoided in patients with bipolar depression as patients can switch from depression into mania

The 4 L's for Bipolar Depression
Lithium, Lamotrigine, Lurasidone, Seroquel

A Randomized Controlled Trial of Cognitive Therapy for Bipolar Disorder: Focus on Long-Term Change

J Clin Psychiatry 2006;67:277-286

Purpose: To evaluate long-term change with cognitive therapy plus emotive techniques for the treatment of bipolar disorder.

Methods: Blinded RCT including patients with DSM-IV bipolar I or II disorder allocated to either a 6 mo trial of cognitive therapy (CT) with emotive techniques or treatment as usual. Both groups received mood stabilizers. Main outcomes were relapse rates, dysfunctional attitudes, psychosocial functioning, hopelessness, self-control, and medication adherence. Patients were assessed by independent raters blinded to treatment group.

Results: At 6 mo, CT patients experienced fewer depressive symptoms and fewer dysfunctional attitudes. There was a non-significant ($p=0.06$) trend to greater time to depressive relapse. At 12 mo follow-up, CT patients had lower Young Mania Rating scores and improved behavioural self-control. At 18 mo, CT patients reported less severity of illness.

Conclusions: CT appears to provide benefits in the 12 mo after completion of therapy.

Anxiety Disorders

Definition

- anxiety is a universal human characteristic involving tension, apprehension, or even terror which serves as an adaptive mechanism to warn about an external threat
- manifestations of anxiety are a result of the activation of the sympathetic nervous system and can be described through P;
 - physiology: main brain structure involved is the amygdala (fear conditioning); neurotransmitters involved include 5-HT, cholecystokinin, epinephrine, norepinephrine, DA
 - psychology: one's perception of a given situation is distorted which causes one to believe it is threatening in some way
 - behaviour: once feeling threatened, one responds by escaping or facing the situation, thereby causing a disruption in daily functioning
- anxiety becomes pathological when:
 - fear is greatly out of proportion to risk/severity of threat
 - response continues beyond existence of threat or becomes generalized to other similar or dissimilar situations
 - social or occupational functioning is impaired
 - often comorbid with substance use and depression

Differential Diagnosis

Table 2. Differential Diagnosis of Anxiety Disorders

Cardiovascular	Post-MI, arrhythmia, congestive heart failure, pulmonary embolus, mitral valve prolapse
Respiratory	Asthma, COPD, pneumonia, hyperventilation
Endocrine	Hyperthyroidism, pheochromocytoma, hypoglycemia, hyperadrenalism, hyperparathyroidism
Metabolic	Vitamin B ₁₂ deficiency, porphyria
Neurologic	Neoplasm, vestibular dysfunction, encephalitis
Substance-Induced	Intoxication (caffeine, amphetamines, cocaine, thyroid preparations, OTC for colds/decongestants), withdrawal (benzodiazepines, alcohol)
Other Psychiatric Disorders	Psychotic disorders, mood disorders, personality disorders (OCPD), somatoform disorders

Medical Workup of Anxiety Disorder

- routine screening: physical exam, CBC, thyroid function test, electrolytes, urinalysis, urine drug screening
- additional screening: neurological consultation, chest X-ray, ECG, CT head

Panic Disorder

DSM-5 Diagnostic Criteria for Panic Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. recurrent unexpected panic attacks - a panic attack is an abrupt surge of intense fear or intense discomfort that reaches a peak within minutes, and during which time four (or more) of the following symptoms occur
- palpitations, pounding heart, or accelerated heart rate
 - sweating
 - trembling or shaking
 - sensations of shortness of breath or smothering
 - feelings of choking
 - chest pain or discomfort
 - nausea or abdominal distress
 - feeling dizzy, unsteady, light-headed, or faint
 - chills or heat sensations
 - paresthesias (numbness or tingling sensations)
 - derealization (feelings of unreality) or depersonalization (being detached from oneself)
 - fear of losing control or "going crazy"
 - fear of dying
- B. 1 mo (or more) of "anxiety about panic attacks" - at least one of the attacks has been followed by one or both of the following:
- persistent concern or worry about additional panic attacks or their consequences
 - a significant maladaptive change in behaviour related to the attacks
- C. the disturbance is not attributable to the physiological effects of a substance or another medical condition
- D. the disturbance is not better explained by another mental disorder

Epidemiology

- prevalence: 2-5% (one of the top five most common reasons to see a family doctor); M:F = 1:2-3
- onset: average early-mid 20s, familial pattern

Treatment

- psychological
 - CBT: interoceptive exposure (eliciting symptoms of a panic attack and learning to tolerate the symptoms without coping strategies); cognitive restructuring (addressing underlying beliefs regarding the panic attacks), relaxation techniques (visualization, box-breathing)
- pharmacological
 - SSRIs: fluoxetine, citalopram, paroxetine, fluvoxamine, sertraline
 - SNRI: venlafaxine
 - with SSRI/SNRIs, start with low doses, titrate up slowly
 - anxiety disorders often require treatment at higher doses for a longer period of time than depression (i.e. full response may take up to 12 wk)
 - treat for up to 1 year after symptoms resolve to avoid relapse
 - to prevent non-compliance due to physical side effects, explain symptoms to expect prior to initiation of therapy
 - other antidepressants (mirtazapine, MAOIs)
 - consider avoiding bupropion or TCAs due to stimulating effects (exacerbate anxious symptoms)
 - benzodiazepines (short-term, low dose, regular schedule, long half-life, avoid prn usage)

Prognosis

- 6-10 yr post-treatment: 30% well, 40-50% improved, 20-30% no change or worse
- clinical course: chronic, but episodic with psychosocial stressors

Figure 2. Panic attack

Criteria for Panic Disorder (≥4)

STUDENTS FEAR the 3 Cs

- Sweating
- Trembling
- Unsteadiness, dizziness
- Depersonalization, Derealization
- Excessive heart rate, palpitations
- Nausea
- Tingling
- Shortness of breath
- Fear of dying, losing control, going crazy
- 3 Cs: Chest pain, Chills, Choking

Panic Attack vs. Panic Disorder

Panic disorder consists of panic attacks + other criteria

Panic attack is not a codable disorder and can occur in the context of many different disorders

Starting Medication for Anxiety

Start low, go slow, aim high and explain symptoms to expect prior to initiation of therapy to prevent non-compliance due to physical side effects

Agoraphobia

DSM-5 Diagnostic Criteria for Agoraphobia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. marked fear or anxiety about two (or more) of the following five situations:
- using public transportation
 - being in open spaces
 - being in enclosed places
 - standing in line or being in a crowd
 - being outside of the home alone
- B. the individual fears or avoids these situations because of thoughts that escape might be difficult or help might not be available in the event of developing panic-like symptoms or other incapacitating or embarrassing symptoms
- C. the agoraphobic situations almost always provoke fear or anxiety
- D. the agoraphobic situations are actively avoided, require the presence of a companion, or are endured with intense fear or anxiety
- E. the fear or anxiety is out of proportion to the actual danger posed by the agoraphobic situations and to the sociocultural context
- F. the fear, anxiety, or avoidance is persistent, typically lasting ≥ 6 mo
- G. the fear, anxiety, or avoidance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning
- H. if another medical condition is present, the fear, anxiety, or avoidance is clearly excessive
- I. the fear, anxiety, or avoidance is not better explained by the symptoms of another mental disorder and are not related exclusively to obsessions, perceived defects or flaws in physical appearance, reminders of traumatic events, or fear of separation
- Note:** agoraphobia is diagnosed irrespective of the presence of panic disorder. If an individual's presentation meets criteria for panic disorder and agoraphobia, both diagnoses should be assigned

Treatment

- as per panic disorder

Generalized Anxiety Disorder

DSM-5 Diagnostic Criteria for Generalized Anxiety Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. excessive anxiety and worry (apprehensive expectation), occurring more days than not for at least 6 mo, about a number of events or activities (such as work or school performance)
- B. the individual finds it difficult to control the worry
- C. the anxiety and worry are associated with three (or more) of the following six symptoms (with at least some symptoms having been present for more days than not for the past 6 mo)
1. restlessness or feeling keyed up or on edge
 2. being easily fatigued
 3. difficulty concentrating or mind going blank
 4. irritability
 5. muscle tension
 6. sleep disturbance (difficulty falling or staying asleep, or restless, unsatisfying sleep)
- D. the anxiety, worry, or physical symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- E. the disturbance is not attributable to the physiological effects of a substance or another medical condition
- F. the disturbance is not better explained by another mental disorder

Epidemiology

- 1 yr prevalence: 3-8%; M:F = 1:2
 - if considering only those receiving inpatient treatment, ratio is 1:1
- most commonly presents in early adulthood

Treatment

- lifestyle: caffeine and EtOH avoidance, sleep hygiene
- psychological: CBT including relaxation techniques, mindfulness
- biological
 - SSRIs and SNRIs are 1st line (paroxetine, escitalopram, sertraline, venlafaxine XL)
 - 2nd line: buspirone (tid dosing), bupropion (caution due to stimulating effects),
 - add-on benzodiazepines (short-term, low dose, regular schedule, long half-life, avoid prn usage)
 - β -blockers not recommended

Prognosis

- chronically anxious adults become less so with age
- depends on pre-morbid personality functioning, stability of relationships, work, and severity of environmental stress
- difficult to treat

Criteria for GAD (≥ 3)

C-FIRST

Concentration issues
 Fatigue
 Irritability
 Restlessness
 Sleep disturbance
 Tension (muscle)

Phobic Disorders

Adopted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

Specific Phobia

- definition: marked and persistent (>6 mo) fear that is excessive or unreasonable, cued by presence or anticipation of a specific object or situation
- lifetime prevalence 12-16%; M:F ratio variable
- types: animal/insect, environment (heights, storms), blood/injection/injury, situational (airplane, closed spaces), other (loud noise, clowns)

Social Phobia (Social Anxiety Disorder)

- definition: marked and persistent (>6 mo) fear of social or performance situations in which one is exposed to unfamiliar people or to possible scrutiny by others; fearing he/she will act in a way that may be humiliating or embarrassing (e.g. public speaking, initiating or maintaining conversation, dating, eating in public)
- 12 mo prevalence rate may be as high as 7%; M:F ratio approximately equal

Diagnostic Criteria for Phobic Disorders

- exposure to stimulus almost invariably provokes an immediate anxiety response; may present as a panic attack
- person recognizes fear as excessive or unreasonable
- situations are avoided or endured with anxiety/distress
- significant interference with daily routine, occupational/social functioning, and/or marked distress

Treatment

- psychological
 - cognitive behaviour therapy (focusing on both in vivo and virtual exposure therapy, gradually facing feared situations)
 - behavioural therapy is more efficacious than medication
- biological
 - SSRIs/SNRIs (e.g. fluoxetine, paroxetine, sertraline, venlafaxine), MAOIs
 - β -blockers or benzodiazepines in acute situations (e.g. public speaking)

Prognosis

- chronic

Obsessive-Compulsive Disorder

DSM-5 Diagnostic Criteria for Obsessive-Compulsive Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- presence of obsessions, compulsions, or both
 - obsessions are defined by (1) and (2)
 - recurrent and persistent thoughts, urges, or images that are experienced, at some time during the disturbance, as intrusive and unwanted, and cause marked anxiety or distress in most individuals
 - the individual attempts to ignore or suppress such thoughts, urges, or images, or to neutralize them with some other thought or action (i.e. by performing a compulsion; see below)
 - compulsions are defined by (1) and (2)
 - repetitive behaviours (e.g. hand washing, ordering, checking) or mental acts (e.g. praying, counting, repeating words silently) that the individual feels driven to perform in response to an obsession or according to rules that must be applied rigidly
 - behaviours mental acts are aimed at preventing or reducing anxiety or distress, or preventing some dreaded event or situation; however, these behaviours or mental acts are not connected in a realistic way with what they are designed to neutralize or prevent, or are clearly excessive
- the obsessions or compulsions are time-consuming (e.g. take >1 h/d) or cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- the obsessive-compulsive symptoms are not attributable to the physiological effects of a substance or another medical condition
- the disturbance is not better explained by the symptoms of another mental disorder

Epidemiology

- 12 mo prevalence 1.1-1.8%; females affected at slightly higher rates than males
- rate of OCD in first-degree relatives is higher than in the general population

Treatment

- CBT: exposure with response prevention (ERP) – involves exposure to feared situations with the addition of preventing the compulsive behaviours; cognitive strategies include challenging underlying beliefs
- pharmacotherapy: SSRIs/SNRIs (12-16 week trials, higher doses vs. depression), clomipramine; adjunctive antipsychotics (risperidone)

Prognosis

- tends to be refractory and chronic

Trauma- and Stressor-Related Disorders

Post-Traumatic Stress Disorder

DSM-5 Diagnostic Criteria for Post-Traumatic Stress Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association.

- A. exposure to actual or threatened death, serious injury, or sexual violence in one (or more) of the following ways:
1. directly experiencing the traumatic event(s)
 2. witnessing, in person, the event(s) as it occurred to others
 3. learning that the traumatic event(s) occurred to a close family member or close friend. In cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental
 4. experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (e.g. first responders collecting human remains; police officers repeatedly exposed to details of child abuse)
- B. presence of one (or more) of the following intrusion symptoms associated with the traumatic event(s), beginning after the traumatic event(s) occurred
1. recurrent, involuntary, and intrusive distressing memories of the traumatic event(s)
 2. recurrent distressing dreams in which the content and/or affect of the dream are related to the traumatic event(s)
 3. dissociative reactions (e.g. flashbacks) in which the individual feels or acts as if the traumatic event(s) were recurring
 4. intense or prolonged psychological distress at exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)
 5. marked physiological reactions to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)
- C. persistent avoidance of stimuli associated with the traumatic event(s), beginning after the traumatic event(s) occurred, as evidenced by one or both of the following
1. avoidance of or efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)
 2. avoidance of or efforts to avoid external reminders (people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)
- D. negative alterations in cognitions and mood associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following
1. inability to remember an important aspect of the traumatic event(s)
 2. persistent and exaggerated negative beliefs or expectations about oneself, others, or the world
 3. persistent, distorted cognitions about the cause or consequences of the traumatic event(s) that lead the individual to blame himself/herself or others
 4. persistent negative emotional state (e.g. fear, horror, anger, guilt, or shame)
 5. markedly diminished interest or participation in significant activities
 6. feelings of detachment or estrangement from others
 7. persistent inability to experience positive emotions
- E. marked alterations in arousal and reactivity associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following
1. irritable behaviour and angry outbursts (with little or no provocation) typically expressed as verbal or physical aggression toward people or objects
 2. reckless or self-destructive behaviour
 3. hypervigilance
 4. exaggerated startle response
 5. problems with concentration
 6. sleep disturbance (e.g. difficulty falling or staying asleep or restless sleep)
- F. duration of the disturbance (criteria B, C, D, and E) is more than 1 mo
- G. the disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning
- H. the disturbance is not attributable to the physiological effects of a substance or another medical condition

Epidemiology

- prevalence of 7% in general population
- men's trauma is most commonly combat experience/physical assault; women's trauma is usually physical or sexual assault

Treatment

- psychotherapy, CBT
 - ensure safety and stabilize: emotional regulation techniques (e.g. breathing, relaxation)
 - once coping mechanisms established, can explore/mourn trauma - challenge dysfunctional beliefs, etc.
 - reconnect and integrate - exposure therapy, etc.

Criteria for Post-Traumatic Stress Disorder

TRAUMA

- Traumatic event
- Re-experience the event
- Avoidance of stimuli associated with the trauma
- Unable to function
- More than a Month
- Arousal increased
- + negative alterations in cognition and mood

Acute Stress Disorder

- May be a precursor to PTSD
- Similar symptoms to PTSD
- Symptoms persist 3 d after a trauma until 1 mo after the exposure

- biological
 - SSRIs (e.g. paroxetine, sertraline)
 - prazosin (for treating disturbing dreams and nightmares)
 - benzodiazepines (for acute anxiety)
 - adjunctive atypical antipsychotics (risperidone, olanzapine)
- eye movement desensitization and reprocessing (EMDR): an experimental method of reprocessing memories of distressing events by recounting them while using a form of dual attention stimulation such as eye movements, bilateral sound, or bilateral tactile stimulation (its use is controversial because of limited evidence)

Complications

- substance abuse, relationship difficulties, depression, impaired social and occupational functioning disorders, personality disorders

Adjustment Disorder

Definition

- a diagnosis encompassing patients who have difficulty coping with a stressful life event or situation and develop acute, often transient, emotional or behavioural symptoms that resemble less severe versions of other psychiatric conditions

DSM-5 Diagnostic Criteria for Adjustment Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- the development of emotional or behavioural symptoms in response to an identifiable stressor(s) occurring within 3 mo of the onset of the stressor(s)
- these symptoms or behaviours are clinically significant as evidenced by either of the following:
 - marked distress that is in excess of what would be expected from exposure to the stressor
 - significant impairment in social or occupational (academic) functioning
- the stress-related disturbance does not meet criteria for another mental disorder and is not merely an exacerbation of a pre-existing mental disorder
- the symptoms do not represent normal bereavement
- once the stressor (or its consequences) has terminated, the symptoms do not persist for more than an additional 6 mo
 - **specifiers:** with depressed mood, with anxiety, with mixed anxiety/depression, with conduct disturbance, with mixed disturbance of conduct/emotions, unspecified

Classification

- types of stressors
 - single (e.g. termination of romantic relationship)
 - multiple (e.g. marked business difficulties and marital problems)
 - recurrent (e.g. seasonal business crises)
 - continuous (e.g. living in a crime-ridden neighbourhood)
 - developmental events (e.g. going to school, leaving parental home, getting married, becoming a parent, failing to attain occupational goals, retirement)

Epidemiology

- F:M 2:1, prevalence 2-8% of the population

Treatment

- brief psychotherapy: individual or group (particularly useful for patients dealing with unique and specific medical issues; e.g. colostomy or renal dialysis groups), crisis intervention
- biological
 - benzodiazepines may be used for those with significant anxiety symptoms (short-term, low-dose, regular schedule)

Bereavement

Clinical Presentation

- bereavement is a normal psychological and emotional reaction to a significant loss, also called grief or mourning
- length and characteristics of "normal" bereavement are variable between individuals/cultures
- normal response: *protest* → *searching and acute anguish* → *despair and detachment* → *reorganization*
- presence of the following symptoms may indicate abnormal grief/presence of MDD
 - guilt about things other than actions taken or not taken by the survivor at the time of death
 - thoughts of death other than the survivor feeling that they would be better off dead or should have died with the deceased person; morbid preoccupation with worthlessness
 - marked psychomotor retardation; prolonged and marked functional impairment
 - hallucinatory experiences other than thinking that the survivor hears the voice of or transiently sees the image of the deceased person
 - dysphoria that is pervasive and independent of thoughts or triggers of the deceased, absence of mood reactivity

Risk Factors for Poor Bereavement Outcome

- Poor social supports
- Unanticipated death or lack of preparation for death
- Highly dependent relationship with deceased
- High initial distress
- Other concurrent stresses and losses
- Death of a child
- Pre-existing psychiatric disorders, especially depression and separation anxiety

- after 12 mo, if patient continues to yearn/long for the deceased, experience intense sorrow/emotional pain in response to the death, remain preoccupied with the deceased or with their circumstance of death, then may start to consider a diagnosis of “persistent complex bereavement disorder”
- if a patient meets criteria for MDD, even in the context of a loss or bereavement scenario, they are still diagnosed with MDD

Treatment

- support and watchful waiting should be first line, as well as education and normalization of the grief process
- screen for increased alcohol, cigarette and drug use
- normal grief should not be treated with antidepressant or anti-anxiety medication, as it is important to allow the person to experience the whole mourning process to achieve resolution
- psychosocial: for those needing additional support, complex grief/bereavement, or significant MDD, grief therapy (individual or group) is indicated
- pharmacotherapy: if MDD present, past history of mood disorders, severe or autonomous symptoms

Bereavement is associated with a significant increase in morbidity and mortality acutely following the loss, with effects seen up to 1 yr after

Loneliness is the most common symptom that continues to persist in normal bereavement and may last several years

Neurocognitive Disorders

Delirium

- see [Neurology, N20](#) and [Geriatric Medicine, G4](#)

DSM-5 Diagnostic Criteria for Delirium

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- attention and awareness: disturbance in attention (i.e. reduced ability to direct, focus, sustain, and shift attention) and awareness (reduced orientation to the environment)
 - acute and fluctuating: disturbance develops over short period of time (usually hours to days), represents a change from baseline attention and awareness, and tends to fluctuate in severity during the course of a day
 - cognitive changes: an additional disturbance in cognition (e.g. memory deficit, disorientation, language, visuospatial ability, or perception)
 - not better explained: disturbances in criteria A and C are not better explained by another neurocognitive disorder (pre-existing, established, or evolving) and do not occur in the context of a severely reduced level of arousal (e.g. coma)
 - direct physiological cause: evidence that disturbance is a direct physiological consequence of another medical condition, substance intoxication or withdrawal (i.e. due to a drug of abuse or medication), toxin, or is due to multiple etiologies
- **Note:** delirium can be described as HYPERactive, HYPOactive, or MIXED presentation. While patients with hyperactive delirium may demonstrate features of restlessness and agitation, as well as experience hallucinations and delusions, those with hypoactive delirium present with lethargy, sedation and respond slowly to questioning

Confusion Assessment Method (CAM) for Diagnosis of Delirium

Highly sensitive and specific method to diagnosis delirium

- Part 1: an assessment instrument that screens for overall cognitive impairment
- Part 2: includes four features found best able to distinguish delirium from other cognitive impairments

Need (1) + (2) + (3 or 4)

- (1) Acute onset and fluctuating course
- (2) Inattention
- (3) Disorganized thinking
- (4) Altered level of consciousness - hyperactive or hypoactive

Visual hallucinations are organic until proven otherwise

Clinical Presentation and Assessment

- common symptoms
 - distractibility, disorientation (time, place, rarely person)
 - misinterpretations, illusions, hallucinations
 - speech/language disturbances (dysarthria, dysnomia)
 - affective symptoms (anxiety, fear, depression, irritability, anger, euphoria, apathy)
 - shifts in psychomotor activity (groping/picking at clothes, attempts to get out of bed when unsafe, sudden movements, sluggishness, lethargy)
 - impairment in sleep duration and/or architecture (e.g. sleep-wake reversal)
- Folstein Mini Mental Status Exam or Montreal Cognitive Assessment are helpful to assess baseline of altered mental state (i.e. score will improve as symptoms resolve)

Risk Factors

- most common precipitating factors include: polypharmacy (particularly involving psychoactive drugs such as anticholinergics), infection, dehydration, immobility, malnutrition, and use of bladder catheters
- other factors include:
 - hospitalization (incidence 10-56%), frail and surgical patients are at the greatest risk
 - previous delirium
 - nursing home residents (incidence 60%)
 - old age (especially males)
 - severe illness (e.g. cancer, AIDS)
 - recent anesthesia or surgery
 - brain vulnerability: substance abuse, past psychiatric illness, pre-existing neurologic or neurocognitive disorder

Investigations

- standard: CBC and differential, electrolytes (including Ca, Mg and PO₄), glucose, BUN, Cr, TSH/T4, LFTs, vit B₁₂, folate, albumin; urinalysis, urine C+S
- as indicated: ECG (to assess QT interval when considering treatment with an antipsychotic agent), CXR, CT head, toxicology/heavy metal screen, VDRL, HIV, LP, blood cultures, EEG (typically abnormal - generalized slowing [most common] or fast activity, can also be used to rule out underlying seizures or post-ictal states as etiology)

Etiology of Delirium

I WATCH DEATH

- Infectious (encephalitis, meningitis, UTI, pneumonia)
- Withdrawal (alcohol, barbiturates, benzodiazepines)
- Acute metabolic disorder (electrolyte imbalance, hepatic or renal failure)
- Trauma (head injury, post-operative)
- CNS pathology (stroke, hemorrhage, tumour, seizure disorder, Parkinson's)
- Hypoxia (anemia, cardiac failure, pulmonary embolus)
- Deficiencies (vitamin B₁₂, folic acid, thiamine)
- Endocrinopathies (thyroid, glucose, parathyroid, adrenal)
- Acute vascular (shock, vasculitis, hypertensive encephalopathy)
- Toxins: substance use, sedatives, opioids (especially morphine), anesthetics, anticholinergics, anticonvulsants, dopaminergic agents, steroids, insulin, glyburide, antibiotics (especially quinolones), NSAIDs
- Heavy metals (arsenic, lead, mercury)

- indications for CT head: focal neurological deficit, acute change in status, anticoagulant use, acute incontinence, gait abnormality, history of cancer
- MRI may be useful to exclude acute or subacute stroke and multifocal inflammatory lesions in patients with delirium of unknown cause and negative head CT

Management

- identify and manage underlying cause
 - identify and treat underlying cause immediately
 - stop all non-essential medications
 - maintain nutrition, hydration, electrolyte balance and monitor vitals
- optimize the environment
 - environment: quiet, well-lit, near window for cues regarding time of day
 - optimize hearing and vision
 - room near nursing station for closer observation; constant care if patient jumping out of bed, pulling out lines
 - family member present for reassurance and re-orientation
 - frequent orientation - calendar, clock, reminders
- pharmacotherapy
 - low dose, high potency antipsychotics: haloperidol has the most evidence; reasonable alternatives include risperidone, olanzapine (more sedating, less QT prolongation), quetiapine (if EPS), aripiprazole (may shorten QTc)
 - benzodiazepines only to be used in alcohol/substance withdrawal delirium; otherwise, can worsen delirium (antipsychotics will not be useful in substance withdrawal delirium)
 - try to minimize anticholinergic side effects
- physical restraints to maintain safety only if necessary (last resort)

Prognosis

- up to 50% 1 yr mortality rate after episode of delirium

Major Neurocognitive Disorder (Dementia)

- see [Neurology, N21](#)

DSM-5 Diagnostic Criteria for Major Neurocognitive Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. evidence of significant cognitive decline from a previous level of performance in one or more cognitive domains (complex attention, executive function, learning and memory, language, perceptual-motor, or social cognition) based on:
1. concern of the individual, a knowledgeable informant, or the clinician that there has been a significant decline in cognitive function; and
 2. substantial impairment in cognitive performance, preferably documented by standardized neuropsychological testing or, in its absence, another quantified clinical assessment
- B. cognitive deficits interfere with independence in everyday activities (i.e. at a minimum, requiring assistance with complex instrumental activities of daily living such as paying bills or managing medications)
- **Note:** if deficits do not interfere as in B, and impairments are mild-moderate as in A, this is considered “mild neurocognitive disorder”; see [Neurology, N21](#)
- C. cognitive deficits do not occur exclusively in the context of a delirium
- D. cognitive deficits are not better explained by another mental disorder (e.g. major depressive disorder, schizophrenia)
- E. in the case of neurodegenerative dementias such as Alzheimer’s Disease, disturbances should be of insidious onset and progressive

Specify whether due to:

Alzheimer’s disease	Normal pressure hydrocephalus	Huntington’s disease
Frontotemporal lobar degeneration	Substance/medication use	Another medical condition
Lewy body disease	HIV infection	Multiple etiologies
Vascular disease	Prion disease	Unspecified
Traumatic brain injury	Parkinson’s disease	

Epidemiology

- prevalence increases with age: 5% in patients >65 yr of age; 35-50% in patients >85 yr of age
- pre-test probability of dementia in an older person with reported memory loss is estimated to be 60%
- prevalence is increased in people with Down’s syndrome and head trauma
- Alzheimer’s disease comprises >50% of cases; vascular causes comprise approximately 15% of cases (other causes of dementia neurocognitive disorder – see [Neurology, N23](#))
- average duration of illness from onset of symptoms to death is 8-10 yr

Subtypes

- with or without behavioural disturbance (e.g. wandering, agitation)
- early-onset: age of onset <65 yr
- late-onset: age of onset >65 yr

The 4 As of Dementia
 Amnesia
 Aphasia
 Apraxia
 Agnosia

The “Mini Cog” Rapid Assessment

- 3 word immediate recall
- Clock drawn to “10 past 11”
- 3 word delayed recall

Flags for Differentiating Most Common Causes of Dementia

Alzheimer’s disease: predominantly memory and learning issues
Frontotemporal degeneration: language type (early preservation), behavioural type (apathy/disinhibition/self-neglect)
Lewy body disease: recurrent, soft visual hallucinations (e.g. rabbits), autonomic impairment (falls, hypotension), EPS, does not respond well to pharmacotherapy, fluctuating degree of cognitive impairment
Vascular disease: vascular risk factors, focal neurological signs, abrupt onset, stepwise progression
Normal pressure hydrocephalus: abnormal gait, early incontinence, rapidly progressive

Investigations (rule out reversible causes)

- standard: *see Delirium, PS19*
- as indicated: VDRL, HIV, SPECT, CT head in dementia
- indications for CT head: same as for delirium, plus: age <60, rapid onset (unexplained decline in cognition or function over 1-2 mo), dementia of relatively short duration (<2 yr), recent significant head trauma, unexplained neurological symptoms (new onset of severe headache/seizures)

Management

- *see Neurology, N20* for further management
- treat underlying medical problems and prevent others
- provide orientation cues for patient (e.g. clock, calendar)
- provide education and support for patient and family (e.g. day programs, respite care, support groups, home care)
- consider long-term care plan (nursing home) and power of attorney/living will
- inform Ministry of Transportation about patient's inability to drive safely
- consider pharmacological therapy
 - cholinesterase inhibitors (e.g. donepezil [Aricept[®]], rivastigmine, galantamine) for mild to severe disease
 - NMDA receptor antagonist (e.g. memantine) for moderate to severe disease
 - low-dose neuroleptics (e.g. risperidone, quetiapine), antidepressants or trazodone if behavioural or emotional symptoms prominent – start low and go slow
 - reassess pharmacological therapy every 3 mo

Table 3. Comparison of Dementia, Delirium, and Pseudodementia of Depression

	Dementia/Major Neurocognitive Disorder	Delirium	Pseudodementia of Depression
Onset	Gradual/step-wise decline	Acute (hours to days)	Subacute
Duration	Months-years	Days-weeks	Variable
Natural History	Progressive Usually irreversible	Fluctuating, reversible High morbidity/mortality in the elderly	Recurrent Usually reversible
Level of Consciousness	Normal	Fluctuating (over 24 h)	Normal
Attention	Not initially affected	Decreased (wandering, easy distraction)	Difficulty concentrating
Orientation	Intact initially	Impaired (usually to time and place), fluctuates	Intact
Behaviour	Disinhibition, impairment in ADL/IADL, personality change, loss of social graces	Severe agitation/retardation	Importuning, self-harm/suicide
Psychomotor	Normal	Fluctuates between extremes	Slowing
Sleep Wake Cycle	Fragmented sleep at night	Reversed sleep wake cycle	Early morning awakening
Mood and Affect	Labile but not usually anxious	Anxious, irritable, fluctuating	Depressed, stable
Cognition	Decreased executive functioning, paucity of thought	Fluctuating preceded by mood changes	Fluctuating
Memory Loss	Recent, eventually remote	Marked recent	Recent. More likely to complain.
Language	Agnosia, aphasia, decreased comprehension, repetition, speech (echolalia, palilalia)	Dysnomia, dysgraphia, speech rambling, irrelevant, incoherent, subject changes	Not affected
Delusions	Compensatory	Nightmarish and poorly formed	Nihilistic, somatic
Hallucinations	Variable	Visual common	Less common, auditory predominates
Quality of Hallucinations	Vacuous/bland	Frightening/bizarre	Self-deprecatory
Medical Status	Variable	Acute illness, drug toxicity	Rule out systemic illness, medications

Substance-Related and Addictive Disorders

Overview

- a neurobiological disorder involving compulsive drug seeking and drug taking, despite adverse consequences, with loss of control over drug use (think issues with the “3 Cs”: compulsive, consequences, control)
- dependence is the hallmark of substance use disorders and comes in the following forms:
 - behavioural: substance-seeking activities and pathological use patterns
 - physical: physiologic withdrawal effects without use
 - psychological: continuous or intermittent cravings for the substance to avoid dysphoria or attain drug state
- abuse: drug use that deviates from the approved social or medical pattern, usually causing impairment or disruption to function in self or others
- these disorders are usually chronic with a relapsing and remitting course

Epidemiology

- 47% of those with substance abuse have mental health problems
- 29% of those with a mental health disorder have a substance use disorder
- 47% of those with schizophrenia and 25% of those with an anxiety disorder have a substance use disorder

Etiology

- almost all drugs (and activities) of abuse increase dopamine in the nucleus accumbens, an action that contributes to their euphoric properties and, with repeated use, to their ability to change signalling pathways in the brain's reward system
- substance use disorders arise from multifactorial interactions between genes (personality, neurobiology) and environment (low socioeconomic status, substance-using peers, abuse history, chronic stress)

Diagnosis

- substance use disorders are measured on a continuum from mild to severe based on the number of criteria met within 12 mo
 - mild: 2-3
 - moderate: 4-5
 - severe: 6 or more
- each specific substance is addressed as a separate use disorder and diagnosed utilizing the same overarching criteria (e.g. a single patient may have moderate alcohol use disorder, and a mild stimulant use disorder)
- testing for illicit drugs is most commonly done on urine or blood samples; Serum toxicology screen is needed to assess alcohol level
- criteria for substance use disorders (**PEC WITH MCAT**)
 - use despite Physical or psychological problem (e.g. alcoholic liver disease or cocaine related nasal problems)
 - failures in important External roles at work/school/home
 - Craving or a strong desire to use substance
 - Withdrawal
 - continued use despite Interpersonal problems
 - Tolerance, needing to use more substance to get same effect
 - use in physically Hazardous situations
 - More substance used or for longer period than intended
 - unsuccessful attempts to Cut down
 - Activities given up due to substance
 - excessive Time spent on using or finding substance

Classification of Substances

	Drugs	Intoxication	Withdrawal
Depressants	Alcohol, opioids, barbiturates, benzodiazepines, GHB	Euphoria, slurred speech, disinhibition, confusion, poor coordination, coma (severe)	Anxiety, anhedonia, tremor, seizures, insomnia, psychosis, delirium, death
Stimulants	Amphetamines, methylphenidate, MDMA, cocaine	Euphoria, mania, psychomotor agitation, anxiety, psychosis (especially paranoia), insomnia, cardiovascular complications (stroke, MI, arrhythmias), seizure	'Crash', craving, dysphoria, suicidality
Hallucinogens	LSD, mescaline, psilocybin, PCP, ketamine, ibogaine, salvia	Distortion of sensory stimuli and enhancement of feelings, psychosis (+ + visual hallucinations), delirium, anxiety (panic), poor coordination	Usually absent

General Approach to Assessment

- ask about socially accepted substances (e.g. nicotine, alcohol) before asking about use of marijuana, misuse of prescription medicines, and about illicit drugs
- obtaining history from family members may be helpful

General Approach to Treatment

- approach must be appropriate to the patient's current state of change (see [Population Health and Epidemiology, Health Promotion Strategies, PH6](#), for Prochaska's Stages of Change Model)
- patients will only change when the pain of change appears less than the pain of staying the same
- provider can help by providing psychoeducation (emphasize neurobiologic model of addiction), motivation, and hope
- principles of motivational interviewing (see [Psychotherapy, PS40](#))
 - non-judgmental stance
 - space for patient to talk and reflect
 - offer accurate empathic reflections back to patient to help frame issue
- encourage and offer referral to evidence based services
 - social: 12-step programs (alcoholics anonymous, narcotics anonymous), family education and support
 - psychological therapy: addiction counselling, motivational enhancement therapy (MET), CBT, contingency management, group therapy, family therapy, marital counselling
 - medical management (differs depending on substance): acute detoxification, pharmacologic agents to aid maintenance
- harm reduction whenever possible: safe-sex practices, avoid driving while intoxicated, avoid substances with child care, safe needle practices/exchange, pill-testing kits, reducing tobacco use
- comorbid psychiatric conditions: many will resolve with successful treatment of the substance use disorder but patients who meet full criteria for another disorder should be treated for that disorder with psychological and pharmacologic therapies

Questions to Characterize Substance Use and Risk Assessment

- When was the last time you used?
- How long can you go without using?
- By what route (oral ingestion, insufflation, smoking, IV) do you usually use?
- Are there any triggers that you know will cause you to use?
- How has your substance use affected your work, school, relationships?
- Substances can be very expensive, how do you support your drug use?
- Have you experienced medical or legal consequences of your use?
- Any previous attempts to cut down or quit, and did you experience any withdrawal symptoms?

Nicotine

- see [Family Medicine, FM11](#)

Alcohol

- see [Family Medicine, FM12](#) and [Emergency Medicine, ER54](#)

History

- **CAGE:** validated screening questionnaire
 - C ever felt the need to Cut down on drinking?
 - A ever felt Annoyed at criticism of your drinking?
 - G ever feel Guilty about your drinking?
 - E ever need a drink first thing in morning (Eye opener)?
 - for men, a score of ≥ 2 is a positive screen; for women, a score of ≥ 1 is a positive screen
 - if positive CAGE, then assess further to distinguish between problem drinking and alcohol use disorder

Confabulations: the fabrication of imaginary experiences to compensate for memory loss

Make sure to ask about other alcohols: mouthwash, rubbing alcohol, methanol, ethylene glycol, aftershave (may be used as a cheaper alternative)

Table 4. Canada's Low-Risk Alcohol Drinking Guidelines

Moderate Drinking		
Men: 3 or less/d (≤ 15 /wk)	Women: 2 or less/d (≤ 10 /wk)	Elderly: 1 or less/d

Alcohol Intoxication

- legal limit for impaired driving is 10.6 mmol/L (50 mg/dL) reached by 2-3 drinks/h for men and 1-2 drinks/h for women
- coma can occur with >60 mmol/L (non-tolerant drinkers) and 90-120 mmol/L (tolerant drinkers)

A "Standard Drink"
 Spirit (40%): 1.5 oz. or 43 mL
 Table Wine (12%): 5 oz. or 142 mL
 Fortified Wine (18%): 3 oz. or 85 mL
 Regular Beer (5%): 12 oz. or 341 mL
 OR
 1 pint of beer = 1.5 SD
 1 bottle of wine = 5 SD
 1 "mickey" = 8 SD (375 ml)
 "26-er" = 17 SD (750 ml)
 "40 oz." = 27 SD

Alcohol Withdrawal

- occurs within 12-48 h after prolonged heavy drinking and can be life-threatening
- alcohol withdrawal can be described as having 4 stages, however not all stages may be experienced:
 - stage 1 (onset 12-18 h after last drink): "the shakes" tremor, sweating, agitation, anorexia, cramps, diarrhea, sleep disturbance
 - stage 2 (onset 7-48 h): alcohol withdrawal seizures, usually tonic-clonic, non-focal and brief
 - stage 3 (onset 48 h): visual, auditory, olfactory or tactile hallucinations
 - stage 4 (onset 3-5 d): delirium tremens, confusion, delusions, hallucinations, agitation, tremors, autonomic hyperactivity (fever, tachycardia, HTN)
- course: almost completely reversible in young; elderly often left with cognitive deficits
- mortality rate 20% if untreated

Management of Alcohol Withdrawal

- monitor using the Clinical Institute Withdrawal Assessment for Alcohol (CIWA-A) scoring system
 - areas of assessment include:
 - ♦ physical (5): nausea and vomiting, tremor, agitation, paroxysmal sweats, headache/fullness in head
 - ♦ psychological/cognitive (2): anxiety, orientation/clouding of sensorium
 - ♦ perceptual (3): tactile disturbances, auditory disturbances, visual disturbances
 - all categories are scored from 0-7 (except: orientation/sensorium 0-4), maximum score of 67
 - ♦ mild <10 , moderate 10-20, severe >20

Delirium Tremens (alcohol withdrawal delirium)

- Autonomic hyperactivity (diaphoresis, tachycardia, increased respiration)
- Hand tremor
- Insomnia
- Psychomotor agitation
- Anxiety
- Nausea or vomiting
- Tonic-clonic seizures
- Visual/tactile/auditory hallucinations
- Persecutory delusions

Table 5. CIWA-A Scale Treatment Protocol for Alcohol Withdrawal

Basic Protocol	Diazepam 20 mg PO q1-2h prn until CIWA-A <10 points Observe 1-2 h after last dose and re-assess on CIWA-A scale Thiamine 100 mg IM then 100 mg PO OD for 3 d Supportive care (hydration and nutrition)
History of Withdrawal Seizures	Diazepam 20 mg PO q1h for minimum of three doses regardless of subsequent CIWA scores
If age >65 or patient has severe liver disease, severe asthma or respiratory failure	Use a short acting benzodiazepine Lorazepam PO/SL/IM 1-4 mg q1-2h
If Hallucinations are present	Haloperidol 2-5 mg IM/PO q1-4h – max 5 doses/d or atypical antipsychotics (olanzapine, risperidone) Diazepam 20 mg x 3 doses as seizure prophylaxis (haloperidol lowers seizure threshold)
Admit to Hospital if	Still in withdrawal after >80 mg of diazepam Delirium tremens, recurrent arrhythmias, or multiple seizures Medically ill or unsafe to discharge home

Wernicke-Korsakoff Syndrome

- alcohol-induced amnesic disorders due to thiamine deficiency
- necrotic lesions: mammillary bodies, thalamus, brainstem
- Wernicke's encephalopathy (acute and reversible): triad of oculomotor dysfunction such as nystagmus (CN VI palsy), gait ataxia, and confusion
- Korsakoff's syndrome (chronic and only 20% reversible with treatment): anterograde amnesia and confabulations; cannot occur during an acute delirium or dementia and must persist beyond usual duration of intoxication/withdrawal
- management
 - Wernicke's: thiamine 100 mg PO OD x 1-2 wk
 - Korsakoff's: thiamine 100 mg PO bid/tid x 3-12 mo

Treatment of Alcohol Use Disorder

- non-pharmacological
 - *see General Approach to Treatment, PS4*
- pharmacological
 - naltrexone (Revia®): opioid antagonist, shown to be successful in reducing the "high" associated with alcohol, moderately effective in reducing cravings, frequency or intensity of alcohol binges
 - disulfiram (Antabuse®): prevents oxidation of alcohol (blocks acetaldehyde dehydrogenase); with alcohol consumption, acetaldehyde accumulates to cause a toxic reaction (vomiting, tachycardia, death); if patient relapses, must wait 48 h before restarting Antabuse®; prescribed only when treatment goal is abstinence. RCT evidence is generally poor or negative
 - acamprostate (Campral®): NMDA glutamate receptor antagonist; useful in maintaining abstinence and decreasing cravings

Opioids

- types of opioids: heroin, morphine, oxycodone, Tylenol #3* (codeine), hydromorphone, fentanyl
- major risks associated with the use of contaminated needles: increased risk of hepatitis B and C, bacterial endocarditis, HIV/AIDS

Acute Intoxication

- direct effect on receptors in CNS resulting in decreased pain perception, sedation, decreased sex drive, nausea/vomiting, decreased GI motility (constipation and anorexia), and respiratory depression

Toxic Reaction

- typical syndrome includes shallow respirations, miosis, bradycardia, hypothermia, decreased level of consciousness
- management
 - ABCs
 - IV glucose
 - naloxone hydrochloride (Narcan®): 0.4 mg up to 2 mg IV for diagnosis
 - treatment: intubation and mechanical ventilation, ± naloxone drip, until patient alert without naloxone (up to >48 h with long-acting opioids)
- caution with longer half-life; may need to observe for toxic reaction for at least 24 h

Withdrawal

- symptoms: depression, insomnia, drug-craving, myalgias, nausea, chills, autonomic instability (lacrimation, rhinorrhea, piloerection)
- onset: 6-12 h; duration: 5-10 d
- complications: loss of tolerance (overdose on relapse), miscarriage, premature labour
- management: long-acting oral opioids (methadone, buprenorphine), α-adrenergic agonists (clonidine)

Treatment of Opioid Use Disorder

- *see General Approach to Treatment, PS4*
- long-term treatment may include withdrawal maintenance treatment with methadone (opioid agonist) or buprenorphine (mixed agonist-antagonist)
- Suboxone® formulation includes naloxone in addition to buprenorphine, in an effort to prevent injection of the drug. When naloxone is injected, it will precipitate opiate withdrawal and block the opiate effect of buprenorphine; however, it will not have this antagonist action when taken sublingually

Cocaine

- street names: blow, C, coke, crack, flake, freebase, rock, snow
- alkaloid extracted from leaves of the coca plant; blocks presynaptic uptake of serotonin (causing euphoria), dopamine (linked to its addictive effect), norepinephrine and epinephrine (causing vasospasm, HTN)
- sodium channel blockade - cocaine slows or blocks nerve conduction and acts as a local anesthetic by altering recovery of neuronal Na⁺ channels. It has a similar effect on cardiac Na⁺ channels and in overdose can manifest on ECG as prolongation of the QRS complex
- self-administered by inhalation (90% bioavailability), insufflation (e.g. intranasal; 80% bioavailability), or intravenous route

Opioid Antagonists Naltrexone vs. Naloxone

Naltrexone (Revia®)

- Can be used for EtOH dependence (although not routinely used)
- Long half life (h)

Naloxone (Narcan®)

- Used for life-threatening CNS/respiratory depression in opioid overdose
- Short half life (<1 h)
- Very fast acting (min)
- High affinity for opioid receptor
- Induces opioid withdrawal symptoms

Maintenance Medication for Opiate Addiction: The Foundation of Recovery

J Addict Dis 2012;31:207-225

Maintenance treatment of opioid addiction with methadone or buprenorphine is associated with retention in treatment, reduction in illicit opiate use, decreased craving, and improved social function. Recently, studies showing extended release naltrexone injections have showed some promise.

- onset and duration of action: onset within seconds if inhaled, lasting 15-30 min; onset in 3-5 min if insufflated, blood levels peak at 10-20 min with effects beginning to fade after 45-60 min. Cocaine has a biologic half-life of 1 h, thus repeated self-administration is common among users to maintain an effect

Intoxication

- elation, euphoria, pressured speech, restlessness, sympathetic stimulation (e.g. tachycardia, mydriasis, sweating)
- prolonged use may result in paranoia and psychosis

Overdose

- medical emergency: HTN, tachycardia, tonic-clonic seizures, dyspnea, and ventricular arrhythmias
- treatment with IV diazepam to control seizures
- beta-blockers (incl. labetalol or propranolol) are not recommended because of risk from unopposed alpha-adrenergic stimulation

Withdrawal

- initial "crash" (1-48 h): increased sleep, increased appetite
- withdrawal (1-10 wk): dysphoric mood plus fatigue, irritability, vivid unpleasant dreams, insomnia or hypersomnia, psychomotor agitation or retardation
- complications: relapse, suicide (significant increase in suicide during withdrawal period)
- management: supportive management

Treatment of Cocaine Use Disorder

- see *General Approach to Treatment, PS4*
- no pharmacologic agents have widespread evidence or acceptance of use

Complications

- cardiovascular: arrhythmias, MI, CVA, ruptured AAA, chest pain (accounts for 40% of all cocaine-related ED visits)
- neurologic: seizures
- psychiatric: psychosis, paranoia, delirium, suicidal ideation
- other: nasal septal deterioration, acute/chronic lung injury "crack lung", possible increased risk of connective tissue disease

Amphetamines

- includes prescription medications for ADHD such as Ritalin® and Adderall®
- intoxication characterized by euphoria, improved concentration, sympathetic and behavioural hyperactivity and at high doses can mimic psychotic mania, can eventually cause coma
- chronic use can produce a paranoid psychosis which can resemble schizophrenia with agitation, paranoia, delusions and hallucinations
- withdrawal symptoms include dysphoria, fatigue, and restlessness
- treatment of amphetamine induced psychosis: antipsychotics for acute presentation, benzodiazepines for agitation, β -blockers for tachycardia, hypertension

Cannabis

- cannabis (marijuana) is the most commonly used recreational drug
- psychoactive substance: delta-9-tetrahydrocannabinol (Δ^9 -THC)
- general clinical manifestations: intoxication characterized by tachycardia, conjunctival vascular engorgement, dry mouth, altered sensorium, increased appetite, and muscle relaxation
- neuropsychiatric effects:
 - altered mood, perception and thought content: increased sense of well-being, euphoria/laughter
 - impaired cognitive and psychomotor performance: reduced reaction time, impaired attention, concentration and short-term memory. It may also impair motor coordination required to complete complex tasks requiring divided attention. Notably, psychomotor impairments may interfere with one's ability to operate heavy machinery such as automobiles
- inhaled marijuana: onset of psychoactive effects occurs rapidly with peak effects felt 15-30 min after intake and lasting up to 4 h
 - acute exacerbation in patients with asthma may be a complication with inhalation
- ingested marijuana: following oral ingestion, psychotropic effects set in with a delay of 30-90 min, reach their maximum after 2-3 h and last for about 4-12 h, depending on dose (*Grotenhermen, 2003, pharmacokinetics and pharmacodynamics of cannabinoids*)
- high doses can cause depersonalization, paranoia, anxiety and may trigger psychosis and schizophrenia if predisposed
- chronic use is associated with tolerance and an apathetic, amotivational state, and increases risk of later manic episodes
- assessment: standard urine drug screens
- treatment of cannabis use disorder: see *General Approach to Treatment, PS4*
- cessation following heavy use produces a significant withdrawal syndrome: irritability, anxiety, insomnia, decreased food intake

Common Presentations of Drug Use

System	Findings
General	Weight loss (especially cocaine, heroin) Injected conjunctiva (cannabis) Pinpoint pupils (opioids) Track marks (injection drugs)
MSK	Trauma
GI	Viral hepatitis (injection drugs) Unexplained elevations in ALT (injection drugs)
Behavioural	Missed appointments Non-compliance Drug-seeking (especially benzodiazepines, opioids)
Psychological	Insomnia Fatigue Depression Flat affect (benzodiazepines, barbiturates) Paranoia (cocaine) Psychosis (cocaine, cannabis, hallucinogens)
Social	Marital discord Family violence Work/school Absenteeism and poor performance

Cannabinoid Hyperemesis Syndrome

An interesting and relatively new clinical phenomenon associated with chronic cannabis use characterized by cyclical, recurrent severe nausea, vomiting, and colicky pain. Possibly due to increased potency of available THC products. Patients often present to ED in acute distress with no evidence of specific GI pathology. Many patients will successfully self-medicate with hot baths or showers

Medical Uses of Marijuana

- Anorexia-cachexia (AIDS, cancer)
- Spasticity, muscle spasms (multiple sclerosis, spinal cord injury)
- Levodopa-induced dyskinesia (Parkinson's Disease)
- Controlling tics and obsessive-compulsive behaviour (Tourette's syndrome)
- Reducing intra-ocular pressure (glaucoma)

Hallucinogens

- types of hallucinogens by primary action
 - 5-HT_{2A} agonists: LSD, mescaline (peyote), psilocybin mushrooms, DMT (ayahuasca)
 - NMDA antagonists: PCP, ketamine
 - κ-opioid agonists: salvia divinorum, ibogaine
- 5-HT_{2A} agonists are most commonly used; intoxication characterized by tachycardia, HTN, mydriasis, tremor, hyperpyrexia, and a variety of perceptual, mood and cognitive changes (rarely, if ever, deadly; treat vitals symptomatically)
- psychological effects of high doses: depersonalization, derealization, paranoia, and anxiety (panic with agoraphobia)
- tolerance develops rapidly (hours-days) to most hallucinogens so physical dependency is virtually impossible, although psychological dependency and problematic usage patterns can still occur
- no specific withdrawal syndrome characterized
- management of acute intoxication
- support, reassurance, diminished stimulation; benzodiazepines or high potency antipsychotics seldom required (if used, use small doses), minimize use of restraints
- long term adverse effects: controversial role in triggering psychiatric disorders, particularly mood or psychosis, thought to be chiefly in individuals with genetic or other risk factors
- Hallucinogen Persisting Perception Disorder: DSM-5 diagnosis characterized by long lasting, spontaneous, intermittent recurrences of visual perceptual changes reminiscent of those experienced with hallucinogen exposure

“Club Drugs”

Table 6. The Mechanism and Effects of Common “Club Drugs”

Drug	Mechanism	Effect	Adverse Effects
MDMA ("Ecstasy", "X", "E", "M", "Molly")	Acts on serotonergic and dopaminergic pathways, properties of a hallucinogen and stimulant	Enhanced sensorium; feelings of well-being, empathy	Sweating, tachycardia fatigue, muscle spasms (especially jaw clenching), ataxia, hyperthermia, arrhythmias, DIC, rhabdomyolysis, renal failure, seizures, death
Gamma Hydroxybutyrate (GHB, "G", "Liquid Ecstasy")	Biphasic dopamine response (inhibition then release) and releases opiate-like substance	Euphoric effects, increased aggression, impaired judgment	Sweating, tachycardia, fatigue, muscle spasms (especially jaw clenching), ataxia, severe withdrawal from abrupt cessation of high doses: tremor, seizures, psychosis
Flunitrazepam (Rohypnol®, "Roofies", "Rope", "The Forget Pill")	Potent benzodiazepine, rapid oral absorption	Sedation, psychomotor impairment, amnesic effects, decreased sexual inhibition	CNS depression with EtOH
Ketamine ("Special K", "Kit-Kat")	NMDA receptor antagonist, rapid-acting general anesthetic used in pediatrics and by veterinarians	"Dissociative" state, profound amnesia/analgesia; hallucinations and sympathomimetic effects	Psychological distress, accidents due to intensity of experience and lack of bodily control. In overdose: decreased LOC, respiratory depression, catatonia
Methamphetamine ("speed", "meth", "chalk", "ice", "crystal")	Amphetamine stimulant, induces norepinephrine, dopamine, and serotonin release	Rush begins in min, effects last 6-8 h, increased activity, decreased appetite, general sense of well-being, tolerance occurs quickly, users often binge and crash	Short-term use: high agitation, rage, violent behaviour, occasionally hyperthermia and convulsions Long-term use: addiction, anxiety, confusion, insomnia, paranoia, auditory and tactile hallucinations (especially fornication), delusions, mood disturbance, suicidal and homicidal thoughts, stroke May be contaminated with lead, and IV users may present with acute lead poisoning
Phencyclidine ("PCP", "angel dust")	Not understood, used by veterinarians to immobilize large animals	Amnesic, euphoric, hallucinatory state	Horizontal/vertical nystagmus, myoclonus, ataxia, autonomic instability (treat with diazepam IV), prolonged agitated psychosis (treat with haloperidol); high risk for suicide; violence towards others High dose can cause coma

Cannabis Use and Risk of Psychotic or Affective Mental Health Outcomes: A Systematic Review

The Lancet 2007;370:319-328

Purpose: To review the evidence for cannabis use and occurrence of psychotic or affective mental health outcomes.

Study Characteristics: A meta-analysis of 35 population-based longitudinal studies, or case-control studies nested within longitudinal designs.

Results: There was an increased risk of any psychotic outcome in individuals who had ever used cannabis (pooled adjusted odds ratio = 1.41, 95% CI 1.20-1.65). Findings were consistent with a dose-response effect, with greater risk in people who used cannabis more frequently (2.09, 95% CI, 1.54-2.84). Findings for depression, suicidal thoughts, and anxiety outcomes were less consistent. In both cases (psychotic and affective outcomes), a substantial confounding effect was present.

Conclusions: The findings are consistent with the view that cannabis increases risk of psychotic outcomes independent of transient intoxication effects, although evidence is less strong for affective outcomes. Although cannabis use and the development of psychosis are strongly associated, it is difficult to determine causality and it is possible that the association results from confounding factors or bias. The authors did conclude that there is sufficient evidence to warn young people that using cannabis could increase their risk of developing a psychotic illness later in life.

Date Rape Drugs

- GHB
- Flunitrazepam (Rohypnol®)
- Ketamine

Emerging Medical Uses of Hallucinogens

Many hallucinogens are currently under investigation for therapeutic benefit; LSD & Psilocybin for end of life anxiety, MDMA for PTSD, Ketamine for rapid treatment of depression, ibogaine derivatives for addiction

Formication

Tactile hallucination that insects or snakes are crawling over or under the skin (especially associated with crystal meth use)

Somatic Symptom and Related Disorders

General Characteristics

- physical signs and symptoms lacking objective medical support in the presence of psychological factors that are judged to be important in the initiation, exacerbation, or maintenance of the disturbance
- cause significant distress or impairment in functioning
- symptoms are produced unconsciously and are not the result of malingering or factitious disorder, which are disorders of voluntary presentation of symptoms (or intentionally inducing, e.g. injecting feces) for secondary gain
- primary gain: somatic symptom represents a symbolic resolution of an unconscious psychological conflict; serves to reduce anxiety and conflict with no external incentive
- secondary gain: the sick role; external benefits obtained or unpleasant duties avoided (e.g. work)

Malingering: intentional production of false or grossly exaggerated physical or psychological symptoms, motivated by secondary gain / external reward (e.g. avoiding work, obtaining financial compensation, or obtaining drugs)

Factitious Disorder: intentional production or feigning of physical or psychological signs or symptoms. Unlike malingering patients are not motivated by secondary gain but rather may seek sympathy, nurturance and attention

Management of Somatic Symptom and Related Disorders

- brief, regular scheduled visits with GP to facilitate therapeutic relationship and help patient feel cared for
- limit number of physicians involved in care, minimize medical investigations; coordinate necessary investigations
- emphasis on what the patient can change and control; the psychosocial coping skills, not their physical symptoms (functional recovery > explanation of symptoms)
- do not tell patient it is "all in their head," emphasize these disorders are real entities or functional in nature
- psychotherapy: CBT, mindfulness interventions, biofeedback, conflict resolution
- minimize psychotropic drugs: anxiolytics in short-term only, antidepressants for comorbid depression and anxiety

Somatic Symptom Disorder

DSM-5 Diagnostic Criteria for Somatic Symptom Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- one or more somatic symptoms that are distressing or result in significant disruption of daily life
 - excessive thoughts, feelings, or behaviours related to the somatic symptoms or associated health concerns as manifested by at least one of the following
 - disproportionate and persistent thoughts about the seriousness of one's symptoms
 - persistently high level of anxiety about health or symptoms
 - excessive time and energy devoted to these symptoms or health concerns
 - although any one somatic symptom may not be continuously present, the state of being symptomatic is persistent (typically >6 mo)
- **somatic symptom disorder with predominant pain** (previously pain disorder) for those whose somatic symptom is primarily pain
 - patients have physical symptoms and believe these symptoms represent the manifestation of a serious illness
 - persistent belief despite negative medical investigations and may develop different symptoms over time
 - lifetime prevalence may be around 5-7% in the general adult population
 - females tend to report more somatic symptoms than males do, cultural factors may influence sex ratio
 - complications: anxiety and depression commonly comorbid (up to 80%), unnecessary medications or surgery
 - often a misdiagnosis for an insidious illness so rule out all organic illnesses (e.g. multiple sclerosis)

Illness Anxiety Disorder

- preoccupation with fear of having, or the idea that one has, a serious disease, to the point of causing significant impairment
- convictions persist despite negative investigations and medical reassurance
- somatic symptoms are mild or not present
- there is a high level of anxiety about health and the individual is easily alarmed about personal health status
- person engages in maladaptive behaviour such as excessive physical checking or total healthcare avoidance
- duration is ≥ 6 mo; onset in 3rd-4th decade of life
- a new diagnostic entity so epidemiology is not well known; however, it is likely less common than SSD
- possible role for SSRIs due to generally high level of anxiety

Conversion Disorder (Functional Neurological Symptom Disorder)

- one or more symptoms or deficits affecting voluntary motor or sensory function that mimic a neurological or GMC (e.g. impaired coordination, local paralysis, double vision, seizures, or convulsions)
- does not need to be preceded by a psychological event as per previous DSM criteria, however this is still worth exploring as many patients will present after such an event or related to a medical diagnosis in a first-degree relative
- 2-5/100,000 in general population; 5% of referrals to neurology clinics
- more common in rural populations and in individuals with little medical knowledge
- spontaneous remission in 95% of acute cases, 50% of chronic cases (>6 mo)
- incompatible findings detected from specific neurological testing can help differentiate between functional and neurological origin (e.g. Hoover's sign, dermatome testing)

la belle indifférence

An inappropriately cavalier patient attitude in the face of serious symptoms; classically associated with conversion disorder

Table 7. Differential of Somatic Symptom and Related Disorders

	Somatic Symptom Disorder	Illness Anxiety Disorder	Conversion Disorder	Factitious Disorder	Malingering
Somatic Symptoms	Present	Mild or absent	Neurologic, voluntary motor or sensory	Psychological or physical	Psychological or physical
Symptoms Produced	Unconsciously	Unconsciously	Unconsciously	Consciously	Consciously
Physical Findings	Absent	Absent	Incompatible	Possible, attempts to falsify	Possible, attempts to falsify

Dissociative Disorders

Definition

- severe dissociation resulting in breakdown of integrated functions of consciousness and perception of self
- differential diagnosis: PTSD, acute stress disorder, borderline personality disorder, somatic symptom disorder, substance abuse, GMC (various neurologic disorders including complex/partial seizures, migraine, Cotard syndrome)

Dissociative Identity Disorder

- disruption of identity characterized by two or more distinct personality states or an experience of possession
- can manifest as sudden alterations in sense of self and agency (ego-dystonic emotions, behaviours, speech)
- features recurrent episodes of amnesia (declarative or procedural)

Dissociative Amnesia

- inability to recall important autobiographical information, usually of a traumatic or stressful nature, that is inconsistent with normal forgetting and not attributable to a psychiatric disorder or medical illness
- localized/selective amnesia: failure to recall all/some events during a prescribed period of time
- generalized amnesia: (more rare) complete loss of memory for one's life history, ± procedural knowledge, ± semantic knowledge. Usually sudden onset. Often presents with perplexity, disorientation, aimless wandering

Depersonalization/Derealization Disorder

- persistent or recurrent episodes of one or both of:
 - depersonalization: experiences of detachment from oneself, feelings of unreality, or being an outside observer to one's thoughts, feelings, speech, and actions (can feature distortions in perception including time, as well as emotional and physical numbing)
 - derealization: experiences of unreality or detachment with respect to the surroundings (e.g. feeling as if in a dream, or that the world is not real, external visual world is foggy or distorted)
- transient (seconds-hours) experiences of this nature are quite common in the general population
- episodes can range from hours-years, patients are often quite distressed and verbalize concern of "going crazy"

Fugue

Purposeful travel or bewildered wandering while in amnesic state

During depersonalization or derealization, patients usually have intact reality testing, which adds to their alarming nature

Sleep Disorders

- for more information regarding normal sleep cycles and the illnesses described, see [Neurology, Sleep Disorders, N46](#)

Overview

- adequate sleep is essential to normal functioning; deprivation can lead to cognitive impairment and increased mortality
- circadian rhythms help regulate mood and cognitive performance
- neurotransmitters commonly implicated in psychiatric illnesses also regulate sleep
 - acetylcholine activity and decreased activity of monoamine neurotransmitters is associated with greater REM sleep
 - decreased adrenergic and cholinergic activity are associated with NREM sleep
- depression is associated with decreased Δ (deep, slow-wave) sleep, decreased REM latency, and increased REM density
- criteria
 - must cause significant distress or impairment in normal functioning
 - not due to a GMC or medications/drugs (unless specified)

Management

- pharmacological treatments are illness-specific
 - non-benzodiazepines preferable (e.g. trazodone, zopiclone, quetiapine), but benzodiazepines a short term option
 - medication should not be prescribed without having first made a diagnosis and considering major psychiatric illnesses (major depression and alcohol use disorders are common etiologies)
- sleep hygiene is a simple, effective, but often underutilized method for addressing sleep disturbances; recommendations include
 - waking up and going to bed at same time every day, including on weekends
 - avoiding long periods of wakefulness in bed
 - not using bed for non-sleep activities (reading, TV, work)
 - avoiding napping
 - discontinuing or reducing consumption of alcohol, caffeine, drugs
 - exercising at least 3-4x per week (but not in the evening, if this interferes with sleep)
- Cognitive Behavioural Therapy for insomnia (CBTi)

Table 8. Major DSM-5 Sleep-Wake Disorders

Note: For more information regarding specific disorders, see: [Neurology, Sleep Disorders, N46](#); [Family Medicine, Sleep Disorders, FM44](#); and [Respirology, Sleep Apnea, R32](#)

Category	Disorder	Description
(Uncategorized)	Insomnia disorder	Difficulty sleeping
	Hypersomnolence disorder	Feeling sleepy throughout the day
	Narcolepsy	Recurrent attacks of irrepressible need to sleep
	Circadian rhythm sleep-wake disorders	Insomnia or excessive sleepiness due to misalignment or alteration in endogenous circadian rhythm
	Restless legs syndrome	Uncomfortable, frequent urge to move legs at night
	Substance/medication-induced sleep disorder	Disturbance in sleep (insomnia or daytime sleepiness) caused by substance/medication intoxication or withdrawal
Breathing-related sleep disorders	Obstructive sleep apnea hypopnea	Breathing issues due to obstruction
	Central sleep apnea	Breathing issues due to aberrant brain signaling
	Sleep-related hypoventilation	Breathing issues due to decreased responsiveness to carbon dioxide levels
Parasomnias	Non-rapid eye movement sleep arousal disorders	Incomplete awakening from sleep, complex motor behaviour without conscious awareness; amnesia regarding episodes; includes symptoms of: Sleepwalking: rising from bed and walking about, blank face, unresponsive, awakened with difficulty Sleep terrors: recurrent episodes of abrupt terror arousals from sleep, usually beginning with a panicky scream, intense fear and autonomic arousal, relative unresponsiveness to comfort during episodes Specifiers: sleep-related sexual behaviour (sexsomnia) and sleep-related eating
	Nightmare disorder	Repeated extended, extremely dysphoric, often very vivid, well-remembered dreams that usually involve significant threats; rapid orientation and alertness on awakening with autonomic arousal
	Rapid eye movement sleep behaviour disorder	Arousal during sleep, associated with vocalization and/or complex motor behaviours; can cause violent injuries; rapid orientation and alertness on awakening

Sexuality and Gender

Gender Dysphoria

Definition

- the distress that may coincide with conflict between one's experienced/expressed gender and one's assigned gender

Typical Presentation

- strong and persistent cross-gender identification
- desire to be rid of primary/secondary sex characteristics and to gain the primary/secondary sex characteristics of their identified gender
- repeated stated desire or insistence that one is of the opposite sex
- preference for cross-dressing, cross-gender roles in make-believe play
- intense desire to participate in the stereotypical games and pastimes of the opposite sex
- strong preference for playmates of the opposite sex
- significant distress or impairment in functioning and persistent discomfort with his or her sex or gender role

Treatment

- psychotherapy
- hormonal therapy
- sexual reassignment surgery

Paraphilic Disorders

Definition

- intense and persistent sexual interest that is not sexual interest in genital stimulation or preparatory fondling with phenotypically normal, physically mature, consenting human partners
- **paraphilic disorder:** paraphilia that causes distress or functional impairment to the individual, or a paraphilia whose realization entails personal harm, or risk of harm to others
- **subtypes:** voyeuristic, exhibitionistic, frotteuristic, sexual masochism, sexual sadism, pedophilic, fetishistic, transvestic, other specified paraphilic disorder, unspecified paraphilic disorder
- rarely self-referred; come to medical attention through interpersonal or legal conflict
- person usually has more than one paraphilia; 5% of paraphilias attributed to women
- typical presentation: begins in childhood or early adolescence; increasing in complexity and stability with age
- chronic, decreases with advancing age but may increase with stress

Treatment

- anti-androgen drugs
- behaviour modification
- psychotherapy

SEXUAL DYSFUNCTION

- see [Gynecology, GY33](#) and [Urology, U34](#)

Eating Disorders

Definition

- eating disorders are characterized by a persistent disturbance of eating that impairs psychosocial functioning or health
- disorders include: anorexia nervosa, avoidant/restrictive food intake disorder, binge eating disorder, bulimia nervosa, pica and rumination disorder.

Epidemiology

- anorexia nervosa (AN): 1% of adolescent and young adult females; onset 13-20 yr old
- bulimia nervosa (BN): 2-4% of adolescent and young adult females; onset 16-18 yr old
- F:M=10:1; mortality 5-10%

Etiology

- multifactorial: psychological, sociological, and biological associations
- individual: perfectionism, lack of control in other life areas, history of sexual abuse
- personality: obsessive-compulsive, histrionic, borderline
- familial: maintenance of weight equilibrium and control in dysfunctional family

- cultural factors: prevalent in industrialized societies, idealization of thinness in the media
- genetic factors
 - AN: 6% prevalence in siblings, with one study of twin pairs finding concordance in 9 of 12 monozygotic pairs versus concordance in 1 of 14 dizygotic pairs
 - BN: higher familial incidence of affective disorders than the general population

Risk Factors

- physical factors: obesity, chronic medical illness (e.g. DM)
- psychological factors: individuals who by career choice are expected to be thin, family history (mood disorders, eating disorders, substance abuse), history of sexual abuse (especially for BN), homosexual males, competitive athletes, concurrent associated mental illness (depression, OCD, anxiety disorder [especially panic and agoraphobia], substance abuse [specifically for BN])

Anorexia Nervosa

DSM-5 Diagnostic Criteria for Anorexia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- intake and weight: restriction of energy intake relative to requirements, leading to a significantly low body weight in the context of age, sex, developmental trajectory, and physical health. Significantly low weight is defined as a weight that is less than minimally normal or, for children and adolescents, less than that minimally expected
 - fear or behaviour: intense fear of gaining weight or of becoming fat, or persistent behaviour that interferes with weight gain, even though at a significantly low weight
 - perception: disturbance in the way in which one's body weight or shape is experienced, undue influence of body weight or shape on self-evaluation, or persistent lack of recognition of the seriousness of the current low body weight
- **specifiers:** partial remission, full remission, severity based on BMI (mild = BMI >17 kg/m², moderate = BMI 16-16.99 kg/m², severe = BMI 15-15.99 kg/m², extreme = BMI <15 kg/m²), type (restricting = during last 3 mo no episodes of binge-eating or purging vs. binge-eating/purging type = in last 3 mo have participated in recurrent episodes of binge-eating/purging)

Management

- psychotherapy: individual, group, family (gold standard): address food and body perception, coping mechanisms, health effects
- medications of little value
- outpatient and inpatient programs are available
- inpatient hospitalization for treatment of eating disorders is rarely on an acute basis (unless there is a concurrent psychiatric reason for emergent admission e.g. suicide risk)
- criteria to admit to medical ward for hospitalization: <65% of standard body weight (<85% of standard body weight for adolescents), hypovolemia requiring intravenous fluid, heart rate <40 bpm, abnormal serum chemistry, or if actively suicidal
- agree on target body weight on admission and reassure this weight will not be surpassed
- monitor for complications of AN (see Table 9, PS33)
- monitor for refeeding syndrome
 - potentially life-threatening metabolic response to refeeding in severely malnourished patients resulting in severe shifts in fluid and electrolyte levels
 - complications include hypophosphatemia, congestive heart failure, cardiac arrhythmias, delirium, and death
 - prevention: slow refeeding, gradual increase in nutrition, supplemental phosphorus, and close monitoring of electrolytes and cardiac status

Prognosis

- early intervention much more effective (adolescent onset has much better prognosis than adult onset)
- 1 in 10 adolescents continue to have anorexia nervosa as adults
- with treatment, 70% resume a weight of at least 85% of expected levels and about 50% resume normal menstrual function
- eating peculiarities and associated psychiatric symptoms are common and persistent
- long-term mortality: 10-20% of patients hospitalized will die in next 10-30 yr (secondary to severe and chronic starvation, metabolic or cardiac catastrophes, with a significant proportion committing suicide)

Bulimia Nervosa

DSM-5 Diagnostic Criteria for Bulimia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- recurrent episodes of binge-eating; an episode of binge-eating is characterized by both of the following
 - eating, in a discrete period of time, an amount of food that is definitely larger than what most individuals would eat during a similar period of time and under similar circumstances
 - a sense of lack of control over eating during the episode
- recurrent inappropriate compensatory behaviour in order to prevent weight gain, such as self-induced vomiting, misuse of laxatives, diuretics, enemas, or other medications, fasting, or excessive exercise

Eating Disorder Screening

Method to identify patients with eating disorders. A "Yes" to two or more questions is associated with a sensitivity and specificity of 78 and 88 percent, respectively

SCOFF

- Do you make yourself Sick because you feel uncomfortably full?
- Do you worry you have lost Control over how much you eat?
- Have you recently lost more than One stone (14 pounds or 6.35 kg) in a three month period?
- Do you believe yourself to be Fat when others say you are too thin?
- Would you say that Food dominates your life?

Athletic Triad

- Disordered eating
- Amenorrhea
- Osteoporosis

Some patients with insulin-dependent DM may stop their insulin in order to lose weight

- C. the binge-eating and inappropriate compensatory behaviours both occur, on average, at least once a week for 3 mo
- D. self-evaluation is unduly influenced by body shape and weight
- E. the disturbance does not occur exclusively during episodes of AN
- **specifiers:** partial remission, full remission, severity (measured in # of inappropriate compensatory behaviours/wk: mild = 1-3, moderate = 4-7, severe = 8-13, extreme = 14+)

Associated Features

- fatigue and muscle weakness due to repetitive vomiting and fluid/electrolyte imbalance
- tooth decay
- swollen appearance around angle of jaw and puffiness of eye sockets due to fluid retention
- reddened knuckles, Russell's sign (knuckle callus from self-induced vomiting)
- trouble concentrating
- weight fluctuation over time

Management

- admission for significant electrolyte abnormalities
- biological: treatment of starvation effects, SSRIs (fluoxetine most evidence) as adjunct
- psychological: develop trusting relationship with therapist to explore personal etiology and triggers, CBT, family therapy, recognition of health risks
- social: challenge destructive societal views of women, use of hospital environment to provide external patterning for normative eating behaviour

Prognosis

- relapsing/remitting disease
- good prognostic factors: onset before age 15, achieving a healthy weight within 2 yr of treatment
- poor prognostic factors: later age of onset, previous hospitalizations, individual and familial disturbance
- 60% good treatment outcome, 30% intermediate outcome, 10% poor outcome

Binge-Eating Disorder

Definition

- recurrent episodes of binge-eating (as defined by criteria A of BN) that are associated with eating much more rapidly than normal, eating until feeling uncomfortably full, eating large amounts when not physically hungry, eating alone because embarrassed by how much one is eating, feeling disgusted with self/depressed, very guilty afterwards at least once/wk x 3 mo
- not associated with any compensatory behaviours
- dieting usually follows binge-eating (vs. BN where dysfunctional dieting typically precedes binge-eating)
- associated with health consequences (e.g. increased risk of weight gain, obesity)

Epidemiology

- F:M = 2:1
- begins in adolescence or young-adulthood

Treatment

- CBT

Avoidant/Restrictive Food Intake Disorder

Definition

- eating/feeding disturbance to the extent of persistent failure to meet appropriate nutritional and/or energy needs, resulting in significant weight loss/growth failure and nutritional deficiencies. Patients experience disturbances in psychosocial functioning and may become dependent on enteral feeding/oral nutritional supplementation
 - does not occur during an episode of AN or BN
 - no evidence of distress in the way in which one's body weight or shape is experienced

Risk Factors

- temperament (e.g. anxiety disorders), environment (e.g. familial anxiety), genetic (e.g. history of GI conditions)
- begins in infancy and can persist into adulthood

Treatment

- psychoeducation
- behaviour modification
- psychotherapy

Points for Differentiating Between Eating Disorders

- AN of binge-eating/purging type (significantly low body weight) takes priority over a BN diagnosis (body weight not in criteria)
- BN requires compensatory behaviours
- Binge eating disorder does not involve compensatory behaviours
- Avoidant/restrictive food intake disorder does not involve disturbances in body image

Table 9. Physiologic Complications of Eating Disorders

System	Starvation/Restriction	Binge-Purge
General	Low BP, low HR, significant orthostatic changes ± syncopal episodes, low temperature, vitamin deficiencies	Russell's sign (knuckle callus) Parotid gland enlargement Perioral skin irritation Periocular and palatal petechiae Loss of dental enamel and caries Aspiration pneumonia Metabolic alkalosis secondary to hypokalemia and loss of acid
Endocrine	Primary or secondary amenorrhea, decreased T ₃ /T ₄	
Neurologic	Seizure (decreased Ca ²⁺ , Mg ²⁺ , PO ₄ ³⁻)	
Cutaneous	Dry skin, lanugo hair, hair loss or thinning, brittle nails, yellow skin from high carotene	
GI	Constipation, GERD, delayed gastric emptying	Acute gastric dilation/rupture, pancreatitis, GERD, hematemesis secondary to Mallory-Weiss tear
CVS	Arrhythmias, CHF	Arrhythmias, cardiomyopathy (from use of ipecac), sudden cardiac death (decreased K ⁺)
MSK	Osteoporosis secondary to hypogonadism	Muscle wasting
Renal	Pre-renal failure (hypovolemia), renal calculi	Renal failure (electrolyte disturbances)
Extremities	Pedal edema (decreased albumin)	Pedal edema (decreased albumin)
Lab Values	Starvation: decreased RBCs, decreased WBCs, decreased LH, decreased FSH, decreased estrogen, decreased testosterone, increased growth hormone, increased cholesterol Dehydration: increased BUN	Vomiting: decreased Na ⁺ , decreased K ⁺ , decreased Cl ⁻ , decreased H ⁺ , increased amylase; hypokalemia with metabolic alkalosis Laxatives: decreased Na ⁺ , decreased K ⁺ , decreased Cl ⁻ , increased H ⁺ ; metabolic acidosis

Important electrolytes in eating disorders: KPMg (potassium, phosphate, magnesium)

Personality Disorders

- in the literature, personality and its disorders are better understood using a trait-based dimensional approach (e.g. 5 major traits such as extraversion, agreeableness, conscientiousness, neuroticism, and openness to experiences rated on a continuum of dysfunctional effects) rather than discrete categories; however, the discrete categories still remain in the current DSM and will be referenced here

General Information

- an enduring pattern of inner experience and behaviour that deviates markedly from the expectations of the individual's culture; manifested in two or more of: cognition, affect, interpersonal functioning, impulse control
- inflexible and pervasive across a range of situations
- pattern is stable and well established by adolescence or early adulthood (vs. a sudden onset)
- associated with many complications, such as depression, suicide, violence, brief psychotic episodes, multiple drug use, and treatment resistance
- relationship building and establishing boundaries are important; focus should be placed on validating, finding things to be truly empathetic about, and speaking to the patient's strengths
- mainstay of treatment is psychotherapy, add pharmacotherapy to treat associated psychiatric disorders (i.e. depression, anxiety, substance abuse)

Classification

- personality disorders are divided into three clusters (A, B, and C), with shared features among disorders within each

A flag for personality disorders in clinical setting is the reaction that a patient is eliciting in you

Personality disorders with familial associations: Schizotypal, Antisocial, and Borderline

Table 10. Description and Diagnosis of Personality Disorders**Cluster A "Mad" Personality Disorders**

- Patients seem odd, eccentric, withdrawn
- Familial association with psychotic disorders
- Common defense mechanisms: intellectualization, projection, magical thinking

Paranoid Personality Disorder (0.5-3%)

Pervasive distrust and suspiciousness of others, interpret motives as malevolent
Blame problems on others and seem angry and hostile

Diagnosis requires 4+ of: **SUSPECT**

1. Suspicious that others are exploiting or deceiving them
2. Unforgiving (bears grudges)
3. Spousal infidelity suspected without justification
4. Perceive attacks on character, counterattacks quickly
5. Enemies or friends? Preoccupied with acquaintance trustworthiness
6. Confiding in others is feared
7. Threats interpreted in benign remarks

Schizoid Personality Disorder

Neither desires nor enjoys close relationships including being a part of a family; prefers to be alone

Lifelong pattern of social withdrawal

Seen as eccentric and reclusive with restricted affect

Diagnosis requires 4 of: **DISTANT**

1. Detached/flat affect, emotionally cold
2. Indifferent to praise or criticism
3. Sexual experiences of little interest
4. Tasks done solitarily
5. Absence of close friends (other than first-degree relatives)
6. Neither desires nor enjoys close relationships (including family)
7. Takes pleasure in few (if any) activities

Cluster B "Bad" Personality Disorders

- Patients seem dramatic, emotional, inconsistent
- Familial association with mood disorders
- Common defense mechanisms: denial, acting out, regression (histrionic PD), splitting (borderline PD), projective identification, idealization/devaluation

Borderline Personality Disorder (2-4%)

Unstable moods and behaviour, feel alone in the world, problems with self-image. History of repeated suicide attempts, self-harm behaviours. Inpatients commonly report history of sexual abuse. Tends to fizzle out as patients age. DBT is the principal treatment (see *Psychotherapy, PS40*)

****10% suicide rate****

Diagnosis requires 5+ of: **IMPULSIVE**

1. Impulsive (min. 2 self-damaging ways, e.g. sex/drugs/spending)
2. Mood/affect instability
3. Paranoia or dissociation under stress
4. Unstable self-image
5. Labile intense relationships
6. Suicidal gestures / self-harm
7. Inappropriate anger
8. Avoiding abandonment (real or imagined, frantic efforts to)
9. Emptiness (feelings of)

Antisocial Personality Disorder (M: 3%, F: 1%)

Lack of remorse for actions, manipulative and deceitful, often violate the law. May appear charming on first impression. Pattern of disregard for others and violation of others' rights must be present before age 15; however, for the diagnosis of ASPD patients must be at least 18. Strong association with Conduct Disorder, history of trauma/abuse common (see *Child Psychiatry*)

Diagnosis requires 3+ of: **CORRUPT**

1. Cannot conform to law
2. Obligations ignored (irresponsible)
3. Reckless disregard for safety
4. Remorseless
5. Underhanded (deceitful)
6. Planning insufficient (impulsive)
7. Temper (irritable and aggressive)

Schizotypal Personality Disorder (3-5.6%)

Pattern of eccentric behaviours, peculiar thought patterns

Diagnosis requires 5+ of: **ME PECULIAR**

1. Magical thinking
 2. Experiences unusual perceptions (including body illusions)
 3. Paranoid ideation
 4. Eccentric behaviour or appearance
 5. Constricted or inappropriate affect
 6. Unusual thinking/speech (e.g. vague, stereotyped)
 7. Lacks close friends
 8. Ideas of reference
 9. Anxiety in social situations
- (Note: Rule out psychotic/pervasive developmental disorders - this is not part of the criteria)

Narcissistic Personality Disorder (2%)

Sense of superiority, needs constant admiration, lacks empathy, but with fragile sense of self. Consider themselves "special" and will exploit others for personal gain

Diagnosis requires 5+ of: **GRANDIOSE**

1. Grandiose
2. Requires excessive admiration
3. Arrogant
4. Needs to be special (and associate with other specials)
5. Dreams of success, power, beauty, love
6. Interpersonally exploitative
7. Others (lacks empathy, unable to recognize feelings/needs of)
8. Sense of entitlement
9. Envious (or believes others are envious)

Histrionic Personality Disorder (1.3-3%)

Attention-seeking behaviour and excessively emotional. Are dramatic, flamboyant, and extroverted. Cannot form meaningful relationships. Often sexually inappropriate

Diagnosis requires 5+ of: **ACTRESS**

1. Appearance used to attract attention
2. Centre of attention (else uncomfortable)
3. Theatrical
4. Relationships (believed to be more intimate than they are)
5. Easily influenced
6. Seductive behaviour
7. Shallow expression of emotions (which rapidly shift)
8. Speech (impressionistic and vague)

Table 10. Description and Diagnosis of Personality Disorders (continued)

<p>Cluster C "Sad" Personality Disorders</p> <ul style="list-style-type: none"> • Patients seem anxious, fearful • Familial association with anxiety disorder • Common defense mechanisms: isolation, avoidance, hypochondriasis 	
<p>Avoidant Personality Disorder (0.5-1.6%) Timid and socially awkward with a pervasive sense of inadequacy and fear of criticism. Fear of embarrassing or humiliating themselves in social situations so remain withdrawn and socially inhibited Diagnosis requires 4+ of: CRINGES</p> <ol style="list-style-type: none"> 1. Criticism or rejection preoccupies thoughts in social situations 2. Restraint in relationships due to fear of being shamed 3. Inhibited in new relationships due to fear of inadequacy 4. Needs to be sure of being liked before engaging socially 5. Gets around occupational activities requiring interpersonal contact 6. Embarrassment prevents new activity or taking risks 7. Self-viewed as unappealing or inferior 	<p>Obsessive-Compulsive Personality Disorder (3-10%) Preoccupation with orderliness, perfectionism, and mental and interpersonal control. Is inflexible, closed-off, and inefficient Diagnosis requires 4+ of: SCRIMPER</p> <ol style="list-style-type: none"> 1. Stubborn 2. Cannot discard worthless objects 3. Rule/detail obsessed (to point of activity lost) 4. Inflexible in matters of morality, ethics, values 5. Miserly 6. Perfectionistic 7. Excludes leisure due to devotion to work 8. Reluctant to delegate to others
<p>Dependent Personality Disorder (1.6-6.7%) Pervasive and excessive need to be taken care of, excessive fear of separation, clinging and submissive behaviours. Difficulty making everyday decisions. Useful to set regulated treatment schedule (regular, brief visits) and being firm about in between issues. Encourage patient to do more for themselves, engage in own problem-solving Diagnosis requires 5 of: RELIANCE</p> <ol style="list-style-type: none"> 1. Reassurance required for everyday decisions 2. Expressing disagreement difficult 3. Life responsibilities assumed by others 4. Initiating projects difficult (because no confidence) 5. Alone (feels helpless and uncomfortable when alone) 6. Nurturance (goes to excessive lengths to obtain) 7. Companionship sought urgently 8. Exaggerated fears of being left to care for self 	

Table 11. Key Differences Among Schizoid, Schizotypal, and Schizophrenia

	Schizoid	Schizotypal	Schizophrenia
Thought Form	Organized	Organized, but vague and circumstantial	Disorganized, tangential, loosening of associations
Thought Content	No psychosis	No psychosis, may have ideas of reference, paranoid ideation, odd beliefs and magical thinking	Psychosis, hallucinations
Relationships	Solitary, NO desire for social relationships	Lacks close relationships, INTERESTED in relationships but socially inept	Socially marginalized, but not by choice

OCPD vs. OCD

	OCPD	OCD
Ego-Syntonic or Ego-Dystonic	Ego-syntonic	Ego-dystonic
Thought Content	Obsessional thinking, no compulsions, strict routine and rigidity in day-to-day matters, more perfectionistic and rigid	Obsessions and compulsions, rituals, anxiety provoking unwanted intrusive thoughts

Consider speaking to children alone. Always consider child abuse. See [Pediatrics, P14](#)

Tips for the Child Interview

- Use language the child will understand (i.e. don't ask about feeling of worthlessness, ask about whether they feel like they're a bad kid)
- Children in some cultures are taught to be quiet and avoid eye contact with adults who are authority figures (do not mistake with depression)
- Use developmentally-appropriate questions (i.e. don't ask about lack of interest in activities, ask children whether they feel bored)

Child Psychiatry

Developmental Concepts

- **temperament:** a child's innate psycho-physiological and behavioural characteristics (e.g. emotionality, activity, and sociability); spectrum from "difficult" to "slow-to-warm-up" to "easy temperament"
- **parental fit:** the congruence between parenting style (authoritative, permissive) and child's temperament
- **attachment:** special relationship between child and primary caretaker(s); develops during first year, the caretaker's attachment style is the best predictor of their child's attachment style, refer to Table 12
- **separation anxiety** (normal between 10-18 mo): where separation from attachment figure results in distress

Table 12. Attachment Models

Parent/Caregiver	Attachment Type	Features in Child
Loving, consistently available, sensitive, and receptive	Secure	Freely explores and engages strangers well (as long as mother in close proximity), upset with caregiver's departure, happy with return
Rejecting, unavailable psychologically, insensitive responses	Insecure (avoidant)	Ignores caregiver, shows little emotion with arrival or departure, little exploration
Inconsistent, insensitive responses, role reversal	Insecure (ambivalent/resistant)	Clingy but inconsolable, often displays anger or helplessness, little exploration
Frightening, dissociated, sexualized, or atypical Often history of trauma or loss	Disorganized	Simultaneous approach/avoidance and stress related straining behaviour

 Suicide/depression

Mood Disorders

MAJOR DEPRESSIVE DISORDER

Epidemiology

- pre-pubertal 1-2% (no gender differences); post-pubertal 4-18% (F:M = 2:1)

Clinical Presentation

- see *Mood Disorders, PS9*
- only difference in diagnostic criteria is that irritable mood may replace depressed mood
- physical factors: insomnia (children), hypersomnia (adolescents), somatic complaints, substance abuse, decreased hygiene
- psychological factors: irritability, boredom, anhedonia, low self-esteem, deterioration in academic performance, social withdrawal, lack of motivation, listlessness
- comorbid diagnoses: anxiety, ADHD, ODD, conduct disorder, and eating disorders

Treatment

- majority never seek treatment
- individual (CBT, IPT), family therapy and education, modified school program
- SSRIs: strongest evidence for fluoxetine. Escitalopram and sertraline would be second line medications of choice
- close follow-up for adolescents starting SSRIs to monitor for increased suicidal ideation or behaviour
- in severe depression, best evidence for combined pharmacotherapy and psychotherapy
- ECT: only in adolescents who have severe illness, psychotic features, catatonic features, persistently suicidal
- internet based psychotherapy, light therapy, self-help books

Prognosis

- prolonged episodes, up to 1-2 yr
- adolescent onset predicts chronic mood disorder; up to 2/3 will have another depressive episode within 5 yr
- complications: negative impact on family and peer relationships, school failure, significantly increased risk of suicide attempt (10%) or completion (however, suicide risk low for pre-pubertal children), substance abuse

DISRUPTIVE MOOD DYSREGULATION DISORDER

Clinical Presentation

- severe, developmentally inappropriate, recurrent verbal or behavioural temper outbursts at least 3x per wk
- mood is predominantly irritable or angry in between outbursts, as observable by others
- these symptoms occur before 10 yr, have been occurring for 12 mo, with no more than 3 consecutive mo free from symptoms
- high rates of comorbidities; ADHD, ODD, anxiety disorders, depressive disorders

BIPOLAR DISORDER

Clinical Presentation

- see *Bipolar Disorder, PS12*
- mixed presentation and psychotic symptoms (hallucinations and delusions) more common in adolescent population than adult population
- unipolar depression may be an early sign of adult bipolar disorder
- ~30% of psychotic depressed adolescents receive a bipolar diagnosis within 2 yr of presentation
- associated with rapid onset of depression, psychomotor retardation, mood-congruent psychosis, affective illness in family, pharmacologically-induced mania

Treatment

- pharmacotherapy: mood stabilizers and/or antipsychotics
- psychotherapy: CBT, Family Focused Therapy

Anxiety Disorders

- lifetime prevalence 10-20%; F:M = 2:1

Clinical Presentation

- children and adolescents rarely vocalize their anxiety but instead exhibit behavioural manifestations
- school problems, recurrent physical symptoms (abdominal pain, headaches) especially in mornings, social and relationship problems, social withdrawal and isolation, family conflict, difficulty with sleep initiation, temper tantrums, irritability and mood symptoms, alcohol and drug use in adolescent

Differential Diagnosis

- depressive disorders, ODD, truancy
- clinical judgment important to differentiate developmentally normal from pathological anxiety
- for school avoidance, differentiate fear of general performance and humiliation. Consider anxiety about separation, and rule out bullying and school refusal due to learning disorder

Course and Prognosis

- better prognosis with later age of onset, lower co-morbidities, early initiation of treatment, ability to maintain school attendance and peer relationships, absence of social anxiety disorder
- with treatment, up to 80% of children will not meet criteria for their anxiety disorder at 3 yr follow-up, but up to 30% will meet criteria for another psychiatric disorder

Treatment

- similar principles for most childhood anxiety disorders due to overlapping symptomatology and frequent comorbidity
- family psychotherapy, predictive and supportive environment
- CBT: child and parental education, relaxation techniques (e.g. deep breathing), exposure/desensitization, recognizing and correcting anxious thoughts
- pharmacotherapy: SSRIs (e.g. fluoxetine), benzodiazepines (alprazolam, clonazepam have evidence – use with caution due to addictive and abuse potential as well as disinhibiting effect, especially in neurodevelopmental delay), fluvoxamine and sertraline also have good evidence, particularly for OCD

SEPARATION ANXIETY DISORDER

- excessive and developmentally inappropriate anxiety on real, threatened, or imagined separation from primary caregiver or home, with physical or emotional distress for at least 4 wk (e.g. worries of something happening to parent or themselves if separated)
- school refusal (75%) and comorbid major depression common (2/3)
- persistent worry, refusal to sleep alone, clinging, nightmares involving separation, somatic symptoms

SOCIAL ANXIETY DISORDER (SOCIAL PHOBIA)

- anxiety, fear, and/or avoidance provoked by situations where child feels under the scrutiny of others
- must distinguish between shy child, child with issues functioning socially (e.g. autism), and child with social anxiety
 - diagnosis only if anxiety interferes significantly with daily routine, social life, academic functioning, or if markedly distressed. Must occur in settings with peers, not just adults
- features: temper tantrums, freezing, clinging behaviour, mutism, excessively timid, stays on periphery, refuses to be involved in group play
- significant implication for future quality of life if untreated; lower levels of satisfaction in leisure activities, higher rates of school dropout, poor workplace performance, increased rates of remaining single

SELECTIVE MUTISM

- consistent failure to speak in specific social situations where speaking is expected, despite speaking in other situations
- the disturbance interferes with educational or occupational achievement or with social communication

GENERALIZED ANXIETY DISORDER

- diagnostic criteria same as adults (see *Generalized Anxiety Disorder*, PS15)
 - note: only 1 item is required in children for Criteria C
- often redo tasks, show dissatisfaction with their work, and tend to be perfectionistic
- often fearful in multiple settings and expect more negative outcomes when faced with academic or social challenges, and require reassurance and support to take on new tasks

SPECIFIC PHOBIA

- common phobias in childhood: fear of heights, small animals, doctors, dentists, darkness, loud noises, thunder, and lightning

Attachment type can be assessed in infants 10-18 mo of age using the Strange Situation test, in which the child is stressed by the caregiver being removed from the situation and the stranger staying. Attachment style is measured by the child's behaviour during the reunion with the caregiver

Attachment problems may present as a child who is difficult to soothe, has difficulty sleeping, problems feeding, tantrums, or behavioural problems

The shy child is quiet and reluctant to participate but slowly 'warms up'

Fluoxetine, Cognitive-Behavioural Therapy and Their Combination for Adolescents with Depression: Treatment for Adolescents with Depression Study (TADS) Randomized Controlled Trial
JAMA 2004;292:807-820

Purpose: To evaluate effectiveness of fluoxetine alone, cognitive behavioural therapy (CBT) alone, CBT with fluoxetine and placebo among adolescents with major depressive disorder (MDD).

Methods: Randomized controlled trial at 13 US academic and community clinics between spring 2000-summer 2003, including patients aged 12-17 with a primary DSM IV diagnosis of MDD assigned to one of the aforementioned four treatment arms. The primary outcome was the Children's Depression Rating Scale-Revised (CDRSR) total score.

Results: Fluoxetine with CBT had a statistically significant CDRSR score as compared to placebo ($p=0.001$) with a 71% response rate. This combination was greater than fluoxetine alone ($p=0.02$), and CBT alone ($p=0.01$). Fluoxetine alone was greater than CBT alone ($p=0.01$).

Conclusion: Combination of fluoxetine with CBT offered the most favourable benefit-risk tradeoff for adolescents with MDD.

Newer Generation Antidepressants for Depressive Disorders in Children and Adolescents
Cochrane Database Syst Rev 2012;11:CD004851

Purpose: To determine the efficacy and adverse outcomes of newer generation antidepressants versus placebo for child and adolescent depressive disorders.

Methods: Meta-analysis of RCTs, crossover trials and cluster trials with children and adolescents aged 6 to 18 years and a diagnosis of depressive disorder, assigned to antidepressants or placebo. Depression severity score was the main outcome measure.

Results: Nineteen trials involving 3,335 participants were included. Children treated with an antidepressant had lower depression severity score and higher rates of response/remission. Children on antidepressants were also found to be at increased risk (58%) of suicide-related outcome (RR 1.58; 95% CI 1.02-2.45).

Conclusions: In children and adolescents, antidepressants are effective at treating depression, yet may cause a higher chance of suicide-related outcomes.

Neurodevelopmental Disorders

Autism Spectrum Disorder

Diagnosis

- persistent deficits in social communication and interaction, manifested in three areas:
 - social-emotional reciprocity, ranging, for example, from abnormal social approach and failure of normal back-and-forth conversation, to reduced sharing of interests, emotions, or affect, to failure to initiate or respond to social interactions
 - nonverbal communicative behaviours, ranging, for example, from poorly integrated verbal and nonverbal communication, to abnormalities in eye contact and body language or deficits in understanding and use of gestures, to a total lack of facial expressions and nonverbal communication
 - developing, maintaining, and understanding relationships, ranging, for example, from difficulties adjusting behaviour to suit various social contexts, to difficulties in sharing imaginative play or in making friends, to absence of interest in peers
- restricted, repetitive patterns of behaviour, interests, or activities. Manifested by two or more of the following:
 - stereotyped or repetitive motor movements, insistence on sameness, highly restricted fixed interests, hyper-/hypo-reactivity to sensory input
- symptoms must be present in early developmental period

- symptoms cause clinically significant impairment in social, occupational, or other important areas of current functioning
- not better explained by intellectual disability or global developmental delay
- **specifiers**
 - current severity: requiring very substantial support, requiring substantial support, requiring support
 - ± language impairment, ± intellectual impairment
 - associated with known medical or genetic condition or environmental factors (i.e. Rett's disorder)

Differential Diagnosis

- developmental disability, childhood schizophrenia, social phobia, OCD, communication disorder, non-verbal learning disorder, ADHD, abuse, hearing or visual impairment, seizure disorder, motor impairment

Management

- hearing and vision test to rule out impairment
- psychological testing to assess intellectual functioning and learning
- chromosomal analysis to rule out abnormalities (e.g. Trisomy 21, Fragile X syndrome)
- rule out psychotic disorders, social problems, depression, anxiety, abuse

Treatment

- team-based: school, psychologist, occupational therapist, physiotherapist, speech and language therapy, pediatrics, psychiatry
- psychosocial: family education and support, school programming, behaviour management, social skills training
- treat concomitant disorders such as ADHD, tics, OCD, anxiety, depression, and seizure disorder
- pharmacotherapy: atypical antipsychotics (for irritability, aggression, agitation, self-mutilation, tics), SSRIs (for anxiety, depression), stimulants (for associated inattention and hyperactivity)

Prognosis

- variable, but improves with early intervention
- better if IQ >60 and able to communicate

Attention Deficit Hyperactivity Disorder

- prevalence: 5-12% of school-aged children; M:F = 4:1, although girls may be under-diagnosed
- girls tend to have inattentive/distractable symptoms; boys have impulsive/hyperactive symptoms

Etiology

- genetic: 75% heritability, dopamine candidate genes DAT1, DRD4
- neurobiology: decreased catecholamine transmission, low prefrontal cortex (PFC) activity, increased beta activity on EEG
- cognitive: developmental disability, poor inhibitory control, and other errors of executive function

Diagnosis

- differential: learning disorders, hearing/visual defects, thyroid, atopic conditions, congenital problems (fetal alcohol syndrome, Fragile X), lead poisoning, history of head injury, traumatic life events (abuse)
- diagnosis requires: onset before age 12, persistent symptoms >6 mo, symptoms present in at least two settings (i.e. home, school, work), interferes with academic, family, and social functioning, and is divided into 3 subtypes
 - combined type: 6 or more symptoms of inattention and "≥6 symptoms of hyperactivity-impulsivity
 - predominantly inattentive type: "≥6 symptoms of inattention
 - predominantly hyperactive-impulsive type: "≥6 symptoms of hyperactivity-impulsivity
 - for older adolescents (>17 yr) or adults, 5 symptoms required
 - does not occur exclusively during the course of another psychiatric disorder

Table 13. Core Symptoms of ADHD (DSM-5)

Inattention	Hyperactivity	Impulsivity
Careless mistakes	Fidgets, squirms in seat	Blurts out answers before questions completed
Cannot sustain attention in tasks or play	Leaves seat when expected to remain seated	Difficulty awaiting turn
Does not listen when spoken to directly	Runs and climbs excessively	Interrupts/intrudes on others
Fails to complete tasks	Cannot play quietly	
Disorganized	"On the go", driven by a motor	
Avoids, dislikes tasks that require sustained mental effort	Talks excessively	
Loses things necessary for tasks or activities		
Distractable		
Forgetful		

Observe child for "ATTENTION" features

- Annoying
- Temperamental
- Energetic
- Noisy
- Task incompletion
- Inattentive
- Oppositional
- Negativism

Treatment with stimulant medications of ADHD in childhood does not increase the likelihood of substance abuse later in life, contrary to the concerns of many parents and health care providers

Features

- difficult to differentiate from highly variable normative behaviour before age 4, but often identified upon school entry
- rule out developmental delay, sensory impairments, genetic syndromes, encephalopathies or toxins (alcohol, lead)
- increased risk of substance abuse, depression, anxiety, academic failure, poor social skills, comorbid CD and/or ODD, adult ASPD
- associated with family history of ADHD, difficult temperamental characteristics

Treatment

- non-pharmacological: parent management, anger control strategies, positive reinforcement, social skills training, individual/family therapy, behaviour therapy, tutors, classroom intervention, exercise routines, extracurricular activities, omega-3 fatty acids
- pharmacological: first line: stimulants (methylphenidate, amphetamine salts); second line: atomoxetine; third line/adjunct: nonstimulants (α -agonists; clonidine, guanfacine, NDRI; bupropion)
- for comorbid symptoms: antidepressants, antipsychotics

Prognosis

- 70-80% continue into adolescence, but hyperactive symptoms usually abate
- 65% continue into adulthood; secondary personality disorders and compensatory anxiety disorders are identifiable

A Systematic Review and Analysis of Long-Term Outcomes in Attention Deficit Hyperactivity Disorder: Effects of Treatment and Non-Treatment

BMC Med 2012;10:99

Purpose: To determine the long-term outcomes of ADHD and whether there is an effect on long-term outcomes with treatment.

Methods: Systematic review of studies, including patients with diagnosed or symptomatic presentation of ADHD, assigned to pharmacological, non-pharmacological or multi-modal treatments or to a no-treatment control. Outcome measures included use/addictive behaviour, academic outcomes, antisocial behaviour, social function, occupation, self-esteem, driving outcomes, services use, and obesity.

Results: Untreated participants with ADHD had poorer outcomes vs. non-ADHD participants in 74% (n=244) of studies, while 26% (n=89) showed similar outcomes. 72% (n=37) of studies showed a benefit from ADHD treatment vs. untreated ADHD and 28% (n=15) showed no benefit. Treatment of ADHD was found to be beneficial in studies looking at driving (100%), obesity (100%), self-esteem (90%), social function (83%), academic outcomes (71%), drug use/addictive behaviour (67%), antisocial behaviour (50%), and occupation (33%).

Conclusion: Overall, people with ADHD have poorer long-term outcomes than controls (those without ADHD). For those with ADHD, treatment improves long-term outcomes.

ODD kids "ARE BRATS"

Annoying
Resentful
Easily annoyed
Blames others
Rule breaker
Argues with adults
Temper
Spiteful/vindictive

Disruptive, Impulse Control, and Conduct Disorder

Oppositional Defiant Disorder

- prevalence: 2-16%, M=F after puberty

Diagnosis

- pattern of negativistic/hostile and defiant behaviour for ≥ 6 mo with ≥ 4 of:
 - **angry/irritable mood:** easily loses temper, touchy or easily annoyed, often angry and resentful
 - **argumentative/defiant:** argues with adults/authority figure, defies requests/rules, deliberately annoys, blames others for their own mistakes or misbehaviour
 - **vindictiveness:** spiteful or vindictive twice in past 6 mo
- behaviour causes significant impairment in social, academic, or occupational functioning
- behaviours do not occur exclusively during the course of a psychotic or mood disorder
- criteria not met for conduct disorder (CD); if ≥ 18 yr, criteria not met for ASPD
- may progress to CD, differentiated by an absence of destructive or physically aggressive behaviour
- features that typically differentiate ODD from transient developmental stage: onset < 8 yr, chronic duration (> 6 mo), frequent intrusive behaviour
- impact of ODD: poor school performance, few friends, strained parent/child relationships, risk of later mood disorders

Treatment

- parent: management training, psychoeducation and family therapy to reduce punitive parenting and parent-child conflict
- behavioural therapy: to teach, practice, and reinforce prosocial behaviour
- social: school/day-care interventions
- pharmacotherapy for comorbid disorders

Conduct Disorder

- prevalence: 1.5-3.4% (M:F = 4-12:1)

Etiology

- parental/familial factors: parental psychopathology (e.g. ASPD, substance abuse), child-rearing practices (e.g. child abuse, discipline), low socioeconomic status (SES), family violence
- child factors: difficult temperament, ODD, learning problems, neurobiology

Diagnosis

- differential: ADHD, depression, head injury, substance abuse
- diagnosis: use multiple sources (Achenbach Child Behavioural Checklist, Teacher's Report Form)
 - pattern of behaviour that violates rights of others and age appropriate social norms with ≥ 3 criteria noted in past 12 mo and ≥ 1 in past 6 mo
 - aggression to people and animals: bullying, initiating physical fights, use of weapons, forced sex, cruel to people and/or animals, stealing while confronting a person (e.g. armed robbery)
 - destruction of property: arson, deliberately destroying others' property
 - deceitfulness or theft: breaking and entering, conning others, stealing nontrivial items without confrontation
 - violation of rules: out all night before age 13, often truant from school before age 13, runaway ≥ 2 times at least overnight or for long periods of time
 - disturbance causes clinically significant impairment in social, academic, or occupational functioning
 - if ≥ 18 yr, criteria not met for ASPD
- diagnostic types
 - childhood onset: at least one criterion prior to age 10
 - ♦ poor prognosis: associated with ODD, aggressiveness, impulsiveness
 - adolescent onset: absence of any criteria until age 10
 - ♦ better prognosis; least aggressive, gang-related delinquency
 - mild, moderate, severe

Treatment

- early intervention necessary and more effective; long-term follow-up required
- psychosocial: parent management training, anger replacement training, CBT, family therapy, education/employment programs, social skills training
- pharmacotherapy: for comorbid disorders

Prognosis

- poor prognostic indicators include early-age onset, high frequency, variety of behaviours, pervasiveness (i.e. in home, school, community), comorbid ADHD, early sexual activity, substance abuse
- 50% of CD children become adult ASPD

Conduct Disorder Diagnosis

TRAP

Theft: breaking and entering, deceiving, non-confrontational stealing
Rule breaking: running away, skipping school, out late
Aggression: people, animals, weapons, forced sex
Property destruction

Intermittent Explosive Disorder

Diagnosis

- recurrent behavioural outbursts representing a failure to control aggressive impulses in children >6 yr, manifested as either
 - verbal or physical aggression that does not damage others or property, occurring 2+ times per wk for 3 mo
 - 3 outbursts involving physical damage to another person, animal or piece of property in the last 12 mo
- outbursts are out of proportion to triggers or provocation, are not premeditated, and not for primary gain
- outbursts cause clinically significant impairment in social, academic, or occupational functioning

See Pediatrics

- Child Abuse, P14
- Chronic Abdominal Pain, P39
- Developmental Delay, P22
- Intellectual Disability, P22
- Learning Disabilities, P24
- Sleep Disturbances, P12

See Neurology

- Tic Disorders, N33
- Tourette's Syndrome, N34

Psychotherapy

- treatment in which a person with mental or physical difficulties aims to achieve symptomatic relief through talks with another person
- psychotherapy is delivered by a specially trained social worker, nurse, psychologist, psychiatrist, counsellor or general practitioner
- various types of therapy exist because of diverse theories of human psychology and mental illness etiology

Common Factors of Psychotherapy

- good evidence that effective psychotherapy creates observable changes in brain circuitry and connectivity, similar to those observed with successful pharmacologic and other treatment modalities
- studies suggest that up to 30-70% of therapy outcome is due to common factors with only 10-40% from specific factors
- common factors are: warmth (unconditional positive regard), accurate empathy, genuineness, goodness of fit

Freudian Psyche

id: instinctual drives, unconscious
superego: person's conscience, formed by societal/parental norms
ego: latin "I", sense of self, conscious actions, attempts to satisfy drives of id within confines of reality and demands of superego

Table 14. Summary of Psychotherapeutic Modalities

Type	Indications	Approach, Technique and Theory	Ideal Candidates	Duration
Psychoanalytic/ Psychodynamic	Psychoneuroses; anxiety, obsessional thinking, compulsive or conversion disorders, sexual dysfunction, depressive states	Theory: Exploration of meaning of early experiences and how they affect emotions and patterns of behaviour Recollection (remembering), repetition (reliving with the analyst), working through (gaining insight) Techniques: free association, dream interpretation, transference analysis	Psychologically minded, highly motivated, wish to understand selves and not just relieve symptoms Able to withstand difficult emotions without fleeing or self-destructive acts High level of function	Time intensive: Classically: 4-5 times/wk for 3-7 yr Psychodynamically oriented therapy: 2-3 times/wk for fewer years
Supportive	Adjustment disorders, psychosomatic disorders, severe psychotic or personality disorders	Ameliorate symptoms through behavioural or environmental restructuring to aid adaptation and facilitate coping Help patients feel safe, secure, and encouraged	Individuals in crisis or with severe symptoms in acute or chronic settings Low insight, low motivation, "weak" ego systems	Variable (single session to years, though often short-intermittent)
Interpersonal	Mood disorders	Focuses on how interpersonal relationships impact symptoms 4 key problem areas addressed: grief and loss, role transitions, conflict, interpersonal deficits Break the interpersonal cycle: depression, self-esteem, social withdrawal	Individuals with depression or bipolar disorder with some insight and difficult social functioning Absence of severe psychotic process, personality disorder, or comorbid substance abuse	12-20 wk
Behavioural	Most mental health disorders benefit from specific application of behavioural therapy (e.g. behavioural activation for depression; exposure therapy for phobias; contingency management for anorexia nervosa and substance use disorder)	Systematic Desensitization: mastering anxiety-provoking situations by approaching them gradually and in a relaxed state that limits anxiety Flooding: confronting feared stimulus for prolonged periods until it is no longer frightening Positive Reinforcement: strengthening behaviour and causing it to occur more frequently by rewarding it Negative Reinforcement: causing behaviour to occur more frequently by removing a noxious stimulus when desired behaviour occurs Extinction: causing a behaviour to diminish by not rewarding it Punishment (aversion therapy): causing a behaviour to diminish by applying a noxious stimulus	Individuals with motivation to change and specific symptoms that are amenable to change Global areas of dysfunction such as personality disorder are difficult to treat with behavioural therapy	Usually short term (weeks-months)
Cognitive Therapy	Depression, anxiety, panic disorder, personality disorders, and somatoform disorders	Moods/emotions are influenced by one's thoughts and psychiatric disturbances are often caused by habitual errors in thinking Therapy helps patient make explicit their inaccurate automatic thoughts and correct assumptions with a more balanced perspective Uses thought records (often charts with column headings including "situation," "feeling," "thought," "cognitive distortion") to help monitor thoughts, the situations they occur in, and the feelings they might provoke due to their underlying cognitive errors	Motivated patients who will comply with homework, openness to changing core beliefs	First course - usually 15-25 wk Maintenance therapy can be carried out over years
Cognitive Behavioural Therapy	Most mental health disorders including; mood, anxiety, OCD, personality, eating, substance use, psychotic disorders	Combines theory and method from Cognitive and Behavioural therapies to teach the patient to change connections between thinking patterns, habitual behaviours, and mood/anxiety problems	Individuals with motivation to change and are able to participate in homework	Typically 6-18 wk, 1 hr sessions Maintenance sessions can be added over time
Dialectical Behavioural Therapy	Borderline Personality Disorder	Therapy that combines CBT techniques with Buddhist Zen mindfulness practices and dialectical philosophy Focuses on 4 types of skills: mindfulness, emotion regulation, interpersonal effectiveness, and distress tolerance Involves 4 components: individual therapy, group skills training, phone consultations, and a consultation team	Patients with severe problems of emotional dysregulation, impulsivity, and self-harm Patients with borderline personality disorder or borderline personality trait	Typically 1 yr
Motivational Interviewing	Substance use disorders	Spirit of MI (CAPE): Compassion, Acceptance, Partnership, Evocation Principles of MI (RULE): Resist "righting reflex", Understand client and their reasons for change, Listen, Empower by conveying hope and supporting autonomy Techniques of MI (OARS): Open-ended questions, Affirmations to validate client, Reflections (the skill of accurate empathy), Summaries to help client organize self	Patients with problematic substance use, maladaptive behaviour patterns (therapy disengagement, medication noncompliance, poor health habits)	Brief interventions (efficacy with as little as 15 min, single sessions), better result with more sessions Addiction is a chronic condition, often need boosters over time
Motivational Enhancement Therapy (MET)	Techniques can be applied to facilitate behavioural change in most psychological problems			MET = 4 sessions

Other Therapies

- group psychotherapy
 - aims to promote self-understanding, acceptance, social skills
- family therapy

family system considered more influential than individual, especially for children
focus on here and now, re-establishing parental authority, strengthening normal boundaries, and rearranging alliances
- mindfulness-based cognitive therapy (MBCT)/stress reduction (MBSR)
 - derived from Buddhist meditative and philosophical practices; aims to help people attend to thoughts, behaviours, and emotions in the moment and non-judgmentally using guided breathing exercises. Emerging evidence for treating adjustment disorder, MDD, anxiety, pain disorders, insomnia, substance relapse prevention
- narrative psychotherapy
 - an integrative approach that attempts to understand the patient's experience as a whole
- hypnosis
 - mixed evidence for treatment of pain, phobias, anxiety, and smoking cessation

Pharmacotherapy

Antipsychotics

- "antipsychotics" and "neuroleptics" are terms used interchangeably
- overall mechanism of action: block, to varying degrees, dopamine activity in target brain pathways)
- indications: for managing agitation, sleep, psychosis and mania reduction, mood stabilizing - used in schizophrenia and other psychotic disorders, mood disorders with or without psychosis, violent behaviour, autism, Tourette's, somatoform disorders, dementia, OCD
- onset: immediate calming effect and decrease in agitation; thought disorder responds in 2-4 wk
- rational use
 - no reason to combine antipsychotics
 - choosing an antipsychotic
 - ♦ all antipsychotics are equally effective, except for clozapine (considered to be most effective in treatment-refractory psychosis)
 - ♦ atypical antipsychotics (SGA) are as effective as typical (first generation) antipsychotics but are thought to have better side effect profiles
 - ♦ choose a drug that the patient has responded to in the past or that was used successfully in a family member
- route: PO, short-acting or long-acting depot IM injections, sublingual
- if no response in 4-6 wk, switch drugs; if response, titrate dose
- duration: minimum 6 mo, usually for life

Long-Acting Preparations

- antipsychotics formulated in oil for IM injection
- received on an outpatient basis
- indications: individuals with schizophrenia or other chronic psychosis who relapse because of non-adherence
- dosing: start at low dosages, then titrate every 2-4 wk to maximize safety and minimize side effects
- should be exposed to oral form prior to first injection
- side effects: risk of EPS, parkinsonism, increased risk of NMS

Canadian Guidelines for the Treatment of Acute Psychosis in the Emergency Setting

- haloperidol 5 mg IM ± lorazepam 2 mg IM
- loxapine 25 mg ± lorazepam 2 mg IM
- olanzapine 2.5-10 mg (PO, IM, quick dissolve)
- risperidone 2 mg (M-tab, liquid)

Two Year Randomized Controlled Trial and Follow-Up of Dialectical Behaviour Therapy (DBT) vs. Therapy by Experts for Suicidal Behaviours and Borderline Personality Disorder

Arch Gen Psychiatry 2006;63:757-66

Purpose: To determine how DBT compares with non-behavioural psychotherapy.
Methods: RCT involving 1 year of DBT or of non-behavioural therapy, followed by 1- year follow-up period. Women with recent suicidal and self-injurious behaviours meeting DSM criteria and matched to various demographic data were included. Primary outcome was trimester assessments of suicidal behaviour, emergency services use and general psychological well-being.
Results: Patients receiving DBT were half as likely to attempt suicide, required less hospitalization for suicidal ideation, had lower medical risk for suicide attempts, were less likely to drop out of therapy, and had fewer emergency room visits for suicidal ideation.
Conclusions: DBT is effective in reducing suicidal behaviour in patients with borderline personality disorder.

Dopamine Pathways Affected by Antipsychotics

Pathway	Effects	Associated Pathology
Mesolimbic	Emotion origination, reward	HIGH dopamine causes positive symptoms of schizophrenia (delusions, hallucinations)
Mesocortical	Cognition, executive function	LOW dopamine causes negative symptoms of schizophrenia
Nigrostriatal	Movement	LOW dopamine causes EPS
Tuberoinfundibular	Prolactin hormone release	LOW dopamine causes hyperprolactinemia

Typical (First Generation) vs. Atypical (Second Generation) Antipsychotics

	Typical	Atypical
Mechanism	Block postsynaptic dopamine receptors (D2)	Block postsynaptic dopamine receptors (D2) Block serotonin receptors (5-HT2) on presynaptic dopaminergic terminals, triggering dopamine release, and reversing dopamine blockade in some pathways
Pros	Inexpensive Plenty of injectable forms available	Fewer EPS Low risk of tardive syndromes Mood stabilizing effects
Cons	More EPS Tardive syndromes in long-term Not mood stabilizing	Expensive Few injectable forms available Metabolic side effects (weight gain, hyperglycemia, lipid abnormalities, metabolic syndrome) Exacerbation (or new onset) of obsessive behaviour

Table 15. Common Antipsychotic Agents

	Starting Dose	Maintenance	Maximum	Relative Potency (mg)
Typicals (in order of potency from high to low)				
Haloperidol (Haldol®)	2-5 mg IM q4-8h 0.5-5 mg PO b/tid 0.2 mg/kg/d PO	Based on clinical effect	20 mg/d PO	2
	Based on clinical effect	20 mg/d PO	2	
Fluphenazine enanthate (Moditen®, Modecate® for IM formulation)	2.5-10 mg/d PO	1-5 mg PO qhs 25 mg IM/SC q1-3wk	20 mg/d PO	2
Zuclopentixol HCl (Clopixol®)	20-30 mg/d PO	20-40 mg/d PO	100 mg/d PO	4
Zuclopentixol acetate (Acuphase®)	50-150 mg IM q48-72h		400 mg IM (q2wk)	
Zuclopentixol decanoate (Cloxipol Depot®)	100 mg IM q1-4wk	150-300 mg IM q2wk	600 mg IM/wk	
Perphenazine (Trilafon®)	8-16 mg PO b/tid	4-8 mg PO t/qid	64 mg/d PO	10
Loxapine HCl (Loxitane®)	10 mg PO tid 12.5-50 mg IM q4-6h	60-100 mg/d PO	250 mg/d PO	10
Chlorpromazine (Largactil®)	10-25 mg PO b/t/qid	400 mg/d PO	1000 mg/d PO	100

Clozapine (Clozaril®)	25 mg PO bid	300-600 mg/d PO	600 mg/d PO	100

Effectiveness of Antipsychotic Drugs in Patients with Chronic Schizophrenia

New Engl J Med 2005;353:1209-23

Purpose: To compare perphenazine with several newer drugs (olanzapine, quetiapine, risperidone, ziprasidone) in patients with chronic schizophrenia.

Methods: Randomized, double-blind, active-control trial with median follow-up of 6 mo, involving patients with a diagnosis of schizophrenia (as per DSM-IV criteria) and able to take antipsychotic medications (as determined by study doctors). Patients were assigned to receive 1-4 capsules daily of olanzapine (20.1 mg), quetiapine (543.4 mg), risperidone (3.9 mg), perphenazine (20.8 mg), or ziprasidone (112.8 mg), with dosage at the discretion of the study doctor. Main outcome was discontinuation of treatment for any cause.

Results: 1,432 patients were included. The olanzapine group had statistically significant lower rate of discontinuation for any cause (64%) from all others (quetiapine – 82%, risperidone – 74%, perphenazine – 75%, ziprasidone – 79%). There were no significant differences in time until discontinuation due to intolerable side effects; however, olanzapine was associated with a significantly higher rate of metabolic side effects.

Conclusion: The majority of patients in each group discontinued treatment due to inefficacy and intolerable side-effects, or for other reasons. Olanzapine was most effective in terms of lowest rates of discontinuation.

Efficacy of conventional antipsychotic agent perphenazine was similar to quetiapine, risperidone and ziprasidone.

Note: high potency antipsychotics (e.g. haloperidol) have low doses, while low potency antipsychotics (e.g. chlorpromazine) have high doses

Anticholinergic Effects

- Red** as a beet
- Hot** as a hare
- Dry** as a bone
- Blind** as a bat
- Mad** as a hatter

Table 16. Commonly Used Atypical Antipsychotics

	Risperidone (Risperdal®)	Olanzapine (Zyprexa®, Zydys®)	Quetiapine (Seroquel®)	Clozapine (Clozaril®)	Aripiprazole (Abilify®)
Advantages	Lower incidence of EPS than typical antipsychotics at lower doses (<8 mg) Associated with less weight gain compared to clozapine and olanzapine	Better overall efficacy compared to haloperidol Well tolerated Low incidence of EPS and TD	Associated with less weight gain compared to clozapine and olanzapine Mood stabilizing	Most effective for treatment-resistant schizophrenia Does not worsen tardive symptoms; may treat them Approximately 50% of patients benefit, especially paranoid patients and those with onset after 20 yr	Less weight gain and risk of metabolic syndrome compared to olanzapine and a lower incidence of EPS compared to haloperidol
Disadvantages	SE: insomnia, agitation, EPS, H/A, anxiety, prolactin, postural hypotension, constipation, dizziness, weight gain Highest risk of EPS among atypicals (still lower than high-potency typicals)	SE: mild sedation, insomnia, dizziness, minimal anticholinergic, early AST and ALT elevation, restlessness High risk of metabolic effects (weight gain, DM, hyperlipidemia)	SE: H/A, sedation, dizziness, constipation Most sedating of first line atypicals	SE: drowsiness/sedation, hypersalivation, tachycardia, myocarditis, cardiomyopathy, dizziness, EPS, NMS 1% agranulocytosis	SE: H/A, agitation, anxiety, insomnia, weight gain, decreased serum prolactin levels
Comments	Quick dissolve (M-tabs), and long-acting (Consta®) formulations available	Quick dissolve formulation (Zydys®) used commonly in ER setting for better compliance IM form available		Weekly blood counts for 6 mo, then q2wk Do not use with drugs which may cause bone marrow suppression due to risk of agranulocytosis	

Note: Risk of weight gain: Clozapine > Olanzapine > Quetiapine > Risperidone

Table 17. Side Effects of Antipsychotics

System	Side Effects
Anticholinergic	Dry mouth, urinary retention, constipation, blurred vision, toxic-confusional states
α-adrenergic Blockade	Orthostatic hypotension, impotence, failure to ejaculate
Dopaminergic Blockade	Extrapyramidal syndromes, galactorrhea, amenorrhea, impotence, weight gain
Anti-histamine	Sedation
Hematologic	Agranulocytosis (clozapine)
Hypersensitivity Reactions	Liver dysfunction, blood dyscrasias, skin rashes, neuroleptic malignant syndrome, altered temperature regulation (hypothermia or hyperthermia)
Endocrine	Metabolic syndrome

Neuroleptic Malignant Syndrome

- **psychiatric emergency**
 - due to massive dopamine blockade; increased incidence with high potency and depot neuroleptics
- **risk factors**
 - medication factors: sudden increase in dosage, starting a new drug
 - patient factors: medical illness, dehydration, exhaustion, poor nutrition, external heat load, male, young adults
- **clinical presentation**
 - mental status changes (usually occur first), fever, autonomic reactivity, rigidity
 - develops over 24-72 h
 - labs: increased creatine phosphokinase, leukocytosis, myoglobinuria
- **treatment:** supportive - discontinue drug, hydration, cooling blankets, dantrolene (hydrantone derivative, used as a muscle relaxant), bromocriptine (DA agonist)
- **mortality:** 5%

Extrapyramidal Symptoms

- incidence related to increased dose and potency
- acute (early-onset; reversible) vs. tardive (late-onset; often irreversible)

Table 18. Extrapyramidal Symptoms

	Dystonia	Akathisia	Pseudoparkinsonism	Dyskinesia
Acute or Tardive	Both	Both	Acute	Tardive
Risk Group	Acute: Young Asian and Black males	Elderly females	Elderly females	
Presentation	Sustained abnormal posture; torsions, twisting, contraction of muscle groups; muscle spasms (e.g. oculogyric crisis, laryngospasm, torticollis)	Motor restlessness; crawling sensation in legs relieved by walking; very distressing, increased risk of suicide and poor adherence	Tremor; rigidity (cogwheeling); akinesia; postural instability (decreased/absent arm-swing, stooped posture, shuffling gait, difficulty pivoting)	Purposeless, constant movements, involving facial and mouth musculature, or less commonly – the limbs
Onset	Acute: within 5 d Tardive: >90 d	Acute: within 10 d Tardive: >90 d	Acute: within 30 d	Tardive: >90 d
Treatment	Acute: benztropine or diphenhydramine	Acute: lorazepam, propranolol, or diphenhydramine; reduce or change neuroleptic to lower potency	Acute: benztropine (or benzodiazepine if side effects); reduce or change neuroleptic to lower potency	Tardive: no good treatment; may try clozapine; discontinue drug or reduce dose

Anticholinergic Agents

- types
 - benztropine (Cogentin®) 2 mg PO, IM, or IV OD (1-6 mg)
 - amantadine (Symmetrel®) 100 mg PO bid (100-400 mg)
 - diphenhydramine (Benadryl®) 25-50 mg PO/IM qid
- do not always prescribe with neuroleptics
 - give anticholinergic agents only if at high risk for acute EPS or if acute EPS develops
- do not give these for tardive syndromes because they worsen the condition

Metabolic and Cardiovascular Adverse Effects Associated with Antipsychotic Drugs
Nat Rev Endocrinol 2012;8:114-126
 All antipsychotics can cause cardiovascular and metabolic side effects, such as obesity, dyslipidemia, hyperglycemia and metabolic syndrome. Olanzapine and clozapine are most likely to cause these side effects. The mechanism that underlies the metabolic and cardiovascular effects is not fully understood, however, the histamine, dopamine, serotonin, and muscarinic receptors are implicated.

QT Prolongation

- Important side effect of antipsychotics
- Consider getting ECG prior to initiating new medication and to monitor side effects
- Typical: chlorpromazine and haloperidol warrant cardiac monitoring
- Atypical: ziprasidone has the highest risk among atypicals, clozapine also warrants monitoring

Selective Serotonin Reuptake Inhibitors (SSRIs) vs. Other Antidepressants for Depression
Cochrane Database Syst Rev 2000;(2):CD001851
Purpose: To examine the relative efficacy of SSRIs versus other antidepressants (e.g., tricyclic antidepressants (TCAs)) for management of depressive disorders.
Methods: Systematic review of RCTs comparing the efficacy of SSRIs with other inds of antidepressants in the treatment of patients with depressive disorders. Outcome measures assessed were measures of depression severity.
Results: Ninety-eight trials were included, with 5,044 patients treated with an SSRI or related drug, and 4,510 with an alternate antidepressant. The standardized effect size for SSRIs and related drugs versus alternative antidepressants was 0.035 (95% CI -0.006 to 0.076; p < 0.001).
Conclusions: There is no clinically significant difference in effectiveness of SSRIs vs. TCAs. Treatment decisions should consider relative patient acceptability, toxicity, and cost.

Antidepressants

- onset of effect
 - relief of neurovegetative/physical symptoms: 1-3 wk
 - relief of emotional/cognitive symptoms: 2-6 wk
- taper TCAs slowly (over weeks-months) because they can cause withdrawal reactions
- tapering of any antidepressant is usually required and is based on the medication's half-life and the patient's individual sensitivity (e.g. fluoxetine does not require a slow taper due to long half life)

- must be vigilant over the first 2 wk of therapy; neurovegetative symptoms may start to resolve while emotional and cognitive symptoms may not (patients may be particularly at risk for suicidal behaviour during this time; in children/adolescents, paroxetine and venlafaxine may increase restlessness and suicide ideation, so are generally not prescribed)
- treatment of bipolar depression
 - patients with bipolar disorder should only be treated with an antidepressant if combined with a mood stabilizer or antipsychotic; monotherapy with antidepressants is not advisable as the depression can turn into mania

Table 19. Common Antidepressants

Class	Drug	Daily Starting Dose (mg)	Therapeutic Dose (mg)	Comments
SSRI	fluoxetine (Prozac®)	20	20-80	Useful for anxiety states, OCD, eating disorders, seasonal depression, typical and atypical depression
	fluvoxamine (Luvox®)	50-100	150-300	All SSRIs have similar effectiveness but consider side effect profiles and half-lives
	paroxetine (Paxil®)	10	20-60	Citalopram, and escitalopram have the fewest drug-interactions and are sleep-wake neutral
	sertraline (Zoloft®)	50	50-200	Sertraline is the safest SSRI in pregnancy and breastfeeding
	citalopram (Celexa®)	20	20-40	Fluoxetine and paroxetine are the most activating drugs (recommend taking in the AM)
	escitalopram (CipraleX®)	10	10-20	Fluoxetine does not require a taper due to long half-life and is the most used in children as it has most evidence Fluvoxamine is sedating (should be taken in PM)
SNRI	venlafaxine (Effexor®)	37.5-75	75-225	Useful for depression, anxiety disorders
	Desvenlafaxine (Pristiq®)	50	50-100	
	duloxetine (Cymbalta®)	30	30-60	
NDRI	bupropion (Wellbutrin®)	100	300-450	Useful for depression, seasonal depression Causes less sexual dysfunction (may reverse effects of SSRIs/SNRIs), weight gain, and sedation Increased risk of seizures at higher doses Contraindicated with history of seizure, stroke brain tumour, brain injury, closed head injury Not recommended for anxiety disorder treatment because of stimulating effects Important to specify formulation, as available in IR, SR, XL (longest)
TCA (3° Amines)	amitriptyline (Elavil®)	75-100	150-300	Useful for OCD (clomipramine), melancholic depression
	imipramine (Tofranil®)	75-100	150-300	
TCA (2° Amines)	nortriptyline (Aventyl®)	75-100	75-150	
	desipramine (Norpramin®)	100-200	150-300	
MAOI	phenelzine (Nardil®)	45	60-90	Useful for moderate/severe depression that does not respond to SSRI, atypical depression
	tranylcypromine (Parnate®)	30	10-60	
RIMA	moclobemide (Manerix®)	300	300-600	Useful for depression unresponsive to other therapies
NASSA	mirtazapine (Remeron®)	15	15-45	Useful in depression with prominent features of insomnia, agitation, or cachexia
Serotonin stimulator	Vortioxetine (Brintellix®)	5-10	5-20	

MAOI = monoamine oxidase inhibitors; NASSA = noradrenergic and specific serotonin antagonists; NDRI = norepinephrine and dopamine reuptake inhibitors; RIMA = reversible inhibition of MAO-A; SNRI = serotonin and norepinephrine reuptake inhibitors; SSRI = selective serotonin reuptake inhibitors; TCA = tricyclic antidepressants

Treatment Approach for Depression

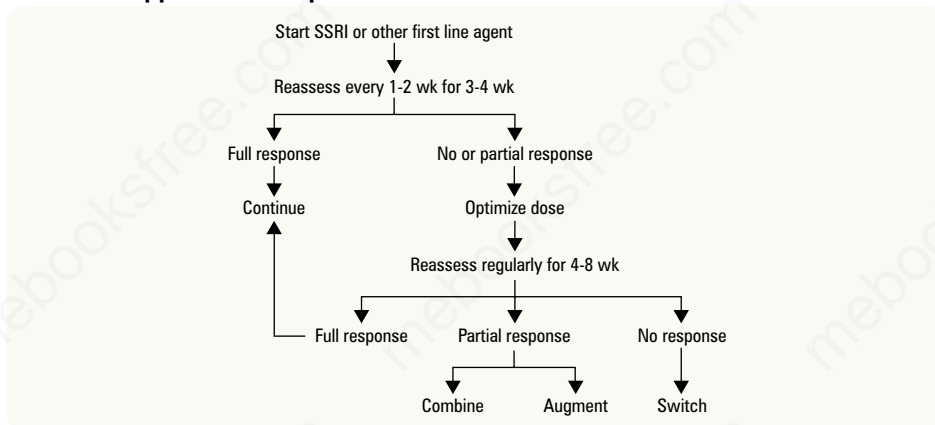

Figure 3. Treatment of depression

- **optimization:** ensuring adequate drug doses for the individual
- **augmentation:** the addition of a medication that is not considered an antidepressant to an antidepressant regimen (e.g. thyroid hormone, lithium, atypical antipsychotics [specifically: olanzapine, risperidone, aripiprazole])
- **combination:** the addition of another antidepressant to an existing treatment regimen (e.g. the addition of bupropion to an SSRI or SNRI)
- **substitute:** change in the primary antidepressant (within or outside a class)
- note: it is important to fully treat depression symptoms in order to decrease relapse rates and severity

Psychopharmacology of SSRIs

Post-Synaptic Serotonin Receptor Stimulated	Effect/Side Effect
5HT1A centrally	• Relief of depression • Anxiolytic effect
5HT2A in spinal cord	• Sexual dysfunction: delayed ejaculation, anorgasmia, decreased interest/libido
5HT2C/5HT2A in brain	• Activation: anxiety, insomnia • Worst with fluoxetine, paroxetine • Warn patients anxiety may worsen in first 1-2 wk of treatment
5HT3A in gut	• GI upset: nausea, vomiting, bloating • Take with food

Table 20. Features of Commonly Used Antidepressant Classes

	SSRI	SNRI	TCA	MAOI	NDRI	RIMA	NASSA
Examples	Fluoxetine, Sertraline, Citalopram	Venlafaxine, Duloxetine	Amitriptyline, Clomipramine	Phenelzine	Bupropion	Moclobemide	Mirtazapine
Mode of Action	Block serotonin reuptake only	Block norepinephrine and serotonin reuptake	Block norepinephrine and serotonin reuptake	Irreversible inhibition of monoamine oxidase A and B Leads to norepinephrine and serotonin	Block norepinephrine and dopamine reuptake	Reversible inhibitor of monoamine oxidase A Leads to norepinephrine and serotonin	Enhance central noradrenergic and serotonergic activity by inhibiting presynaptic α -2 adrenergic receptors
Side Effects	Fewer than TCA, therefore increased compliance CNS: restlessness, tremor, insomnia, headache, drowsiness GI: N/V, diarrhea, abdominal cramps, weight loss Sexual dysfunction: impotence, anorgasmia CVS: increased HR, conduction delay, serotonin syndrome, EPS, SIADH	Low dose side effects include insomnia (serotonergic) Higher dose side effects include: tremors, tachycardia, sweating, insomnia, dose-dependent increase in diastolic BP (noradrenergic)	Anticholinergic effects: (see Table 17, PS44) Noradrenergic effects: tremors, tachycardia, sweating, insomnia, erectile and ejaculation problems α -1 adrenergic effects: orthostatic hypotension	Antihistamine effects: sedation, weight gain CNS: sedation, stimulation, seizure threshold CVS: HR, conduction delay Hypertensive crises with tyramine rich foods (e.g. wine, cheese), headache, flushes, palpitations, N/V, photophobia, dizziness, reflex tachycardia, postural hypotension, sedation, insomnia, weight gain, social dysfunction Energizing Minimal anticholinergic and antihistamine effects	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, HTN GI: dry mouth, N/V, constipation, appetite Other: agitation, anxiety, anaphylactoid reaction	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, hypotension GI: dry mouth, N/V, diarrhea, abdominal pain, dyspepsia GU: delayed ejaculation Other: diaphoresis	CNS: somnolence, dizziness, seizure (rare) Endocrine: cholesterol, triglycerides GI: constipation, ALT
Risk in Overdose	Relatively safe in OD	Tachycardia and N/V seen in acute overdose	Toxic in OD 3 times therapeutic dose is lethal Presentation: anticholinergic effects, CNS stimulation, then depression and seizures ECC: prolonged QT (duration reflects severity) Treatment: activated charcoal, cathartics, supportive treatment, IV diazepam for seizure, physostigmine salicylate for coma Do not give ipecac, as can cause rapid neurologic deterioration and seizures	Toxic in OD, but wider margin of safety than TCA	Tremors and seizures seen in acute overdose	Risk of fatal overdose when combined with citalopram or clomipramine	Mild symptoms with overdose
Drug Interactions	SSRIs inhibit P450 enzymes, therefore will affect levels of drugs metabolized by P450 system	MAOI, SSRI Less likely to interact with cytochrome P450 (CYP) compounds	MAOI, SSRI EtOH	EtOH Hypertensive crises with noradrenergic medications (e.g. TCA, decongestants, amphetamines) Serotonin syndrome with serotonergic drugs (e.g. SSRI, tryptophan, dextromethorphan)	MAOI Drugs that reduce seizure threshold: antipsychotics, systemic steroids, quinolone antibiotics, antimalarial drugs	MAOI, SSRI, TCA Opioids	MAOI, SSRI, SNRI, RIMA

Serotonin Syndrome

- thought to be due to over-stimulation of the serotonergic system
- can result from medication combinations such as SSRI+MAOI, SSRI+tryptophan, MAOI+mepredine, MAOI+tryptophan
- rare but potentially life-threatening adverse reaction to SSRIs, especially when switching from an SSRI to an MAOI
- symptoms include nausea, diarrhea, palpitations, chills, restlessness, confusion, and lethargy but can progress to myoclonus, hyperthermia, rigor and hypertonicity
- treatment: discontinue medication and administer emergency medical care as needed
- important to distinguish from NMS

Discontinuation Syndrome

- caused by the abrupt cessation of an antidepressant; most commonly with paroxetine, fluvoxamine, and venlafaxine (drugs with shortest half-lives)
- symptoms usually begin within 1-3 d and include: anxiety, insomnia, irritability, mood lability, nausea/vomiting, dizziness, headache, dystonia, tremor, chills, fatigue, lethargy, and myalgia
- treatment: symptoms may last between 1-3 wk, but can be relieved within 24 h by restarting antidepressant therapy at the same dose the patient was taking and initiating a slow taper over several weeks
- consider using a drug with a longer half-life such as fluoxetine

**Symptoms of Antidepressant Discontinuation**

FINISH
 Flu-like symptoms
 Insomnia
 Nausea
 Imbalance
 Sensory disturbances
 Hyperarousal (anxiety/agitation)

Sequenced Treatment Alternatives to Relieve Depression
J Psychosoc Nurs Ment Health Serv 2008;46:21-24
Purpose: To compare the efficacy and tolerability of various antidepressant therapies through four sequential treatment levels.
Methods: Prospective randomized anti-depressant treatment trial involving patients with major depressive disorder (MDD), assigned to the following interventions: Level 1-citalopram; if relapse, Level 2-citalopram + bupropion SR, sertraline, venlafaxine XR, or cognitive psychotherapy; Level 2A-switch to bupropion or venlafaxine XR; Level 3-either mirtazapine or nortriptyline + lithium, T3; and Level 4-tranylcypromine or venlafaxine XR + mirtazapine. All patients started at Level 1, with the three subsequent levels being randomized and open-label. Patients were treated up to 12 weeks at each level with an optional week 14 visit if needed.
Results: Remission rates were 28% for Level 1, 17% for Level 2, 12-25% for Level 3, and 7-14% for Level 4. When more treatment steps are required, there were lower remission rates, greater degrees of tolerance, and higher rates of relapse.
Conclusion: More treatment steps needed was predictive of lower remission rates and greater rates of tolerance and relapse.

Mood Stabilizers

General Prescribing Information

- examples: lithium, lamotrigine, divalproex, carbamazepine
- used in conjunction with atypical antipsychotics for managing episodes of bipolar disorder - depression, mania, stabilization
- vary in their ability to “treat” (reduce symptoms acutely) or “stabilize” (prevent relapse and recurrence) manic and depressive symptoms; multi-agent therapy is common
- before initiating, get baseline: CBC, ECG (if patient >45 yr old or cardiovascular risk), urinalysis, BUN, Cr, electrolytes, TSH
- before initiating lithium: screen for pregnancy, thyroid disease, seizure disorder, neurological, renal, cardiovascular diseases
- full effects not for 2-4 wk, thus may need acute coverage with benzodiazepines or antipsychotics

Specific Prescribing Information

- detailed pharmacological guidelines available online from the Canadian Network for Mood and Anxiety Treatments (CANMAT) and International Society for Bipolar Disorders (ISBD)
- for clinical information for treating bipolar disorder (see *Mood Disorders, PS9*)

Table 21. Commonly Used Mood Stabilizers

	Lithium	Lamotrigine (Lamictal®)	Divalproex (Epival®)	Carbamazepine (Tegretol®)
Indications	<p>1st line Acute mania (monotherapy or with adjunct SGA) Bipolar I depression (monotherapy or in combination with SSRI, divalproex, or bupropion) Bipolar disorder maintenance (monotherapy or with adjunct SGA)</p> <p>Other uses Bipolar II depression Augmentation of antidepressants in MDE and OCD Schizoaffective disorder Chronic aggression antisocial behaviour Recurrent depression</p>	<p>1st line Bipolar I depression (monotherapy) Bipolar disorder maintenance (limited efficacy in preventing mania, more effective when combined with lithium)</p> <p>Other uses Bipolar II depression</p> <p>Not recommended for: Acute mania as monotherapy</p>	<p>1st line Acute mania (monotherapy or with adjunct SGA) Bipolar I depression (combination with SSRI or lithium) Bipolar disorder maintenance (monotherapy or with adjunct SGA)</p> <p>Other uses Bipolar II depression Rapid cycling bipolar disorder Mixed phase/dysphoric mania</p>	<p>2nd line Acute mania (monotherapy) Bipolar disorder maintenance (monotherapy or in combination with lithium)</p> <p>Other uses Rapid cycling bipolar disorder</p>
Mode of Action	Unknown Therapeutic response within 7-14 d	May inhibit 5-HT3 receptors May potentiate DA activity	Depresses synaptic transmission Raises seizure threshold	Depresses synaptic transmission Raises seizure threshold
Dosage	Adult: 600-1500 mg/d Geriatric: 150-600 mg/d Usually daily dosing	Starting: 12.5-15 mg/d Daily dose: 100-200 mg/d Dose adjusted in patients taking other anticonvulsants Note: very slow titration due to risk of Stevens-Johnson Syndrome	750-2500 mg/d Usually tid dosing	400-1600 mg/d Usually bid or tid dosing
Therapeutic Level	Adult: 0.8-1.0 mmol/L (1.0-1.25 mmol/L for acute mania) Geriatric: 0.5-0.8 mmol/L	Therapeutic plasma level not established Dosing based on therapeutic response	17-50 mmol/L Therapeutic levels are for seizure prophylaxis	350-700 µmol/L
Monitoring	Monitor serum levels until therapeutic (always wait 12 h after dose) Then monitor biweekly or monthly until a steady state is reached, then q2mo Monitor thyroid function q6mo, creatinine q6mo, urinalysis q1yr	Monitor for suicidality, particularly when initiating treatment	LFTs weekly x 1 mo, then monthly, due to risk of liver dysfunction Watch for signs of liver dysfunction: nausea, edema, malaise Monitor levels to confirm adherence	Weekly blood counts for first month, due to risk of agranulocytosis Watch for signs of blood dyscrasias: fever, rash, sore throat, easy bruising
Side Effects	GI: N/V, diarrhea, stomach pain GU: polyuria, polydipsia, GN, renal failure, nephrogenic DI CNS: fine tremor, lethargy, fatigue, headache Hematologic: reversible leukocytosis Other: teratogenic (Ebstein's anomaly), weight gain, edema, psoriasis, hypothyroidism, hair thinning, muscle weakness, ECG changes	GI: N/V, diarrhea CNS: ataxia, dizziness, diplopia, headache, somnolence Skin: rash (should discontinue drug because of risk of Stevens-Johnson syndrome), increased lamotrigine levels = increased risk of rash Other: anxiety	GI: liver dysfunction, N/V, diarrhea CNS: ataxia, drowsiness, tremor, sedation, cognitive blurring Other: hair loss, weight gain, transient thrombocytopenia, neural tube defects when used in pregnancy	GI: N/V, diarrhea, hepatic toxicity CNS: ataxia, dizziness, slurred speech, drowsiness, confusion, nystagmus, diplopia Hematologic: transient leukopenia (10%), agranulocytosis, aplastic anemia Skin: rash (5% risk; should discontinue drug because of risk of Stevens-Johnson syndrome) Other: neural tube defects when used in pregnancy
Interactions	NSAIDs decrease clearance		OCP	OCP

Lithium Toxicity

- clinical diagnosis as toxicity can occur at therapeutic levels
- common causes:** overdose, sodium/fluid loss, concurrent medical illness
- clinical presentation**
 - GI: severe nausea/vomiting and diarrhea
 - cerebellar: ataxia, slurred speech, lack of coordination
 - cerebral: drowsiness, myoclonus, tremor, upper motor neuron signs, seizures, delirium, coma
- management**
 - discontinue lithium for several doses and begin again at a lower dose when lithium level has fallen to a non-toxic range
 - serum lithium levels, BUN, electrolytes
 - saline infusion
 - hemodialysis if lithium >2 mmol/L, coma, shock, severe dehydration, failure to respond to treatment after 24 h, or deterioration

Long-term lithium use can lead to a nephropathy and diabetes insipidus in some patients

Anxiolytics

- anxiolytics mask or alleviate symptoms; they do not cure them
- indications**
 - short-term treatment of transient forms of anxiety disorders, insomnia, alcohol withdrawal (especially delirium tremens), barbiturate withdrawal, organic brain syndrome (acute agitation in delirium), EPS and akathisia due to antipsychotics, seizure disorders, musculoskeletal disorders
- relative contraindications**
 - major depression (except as an adjunct to other treatment), history of drug/alcohol abuse, caution in pregnancy/breastfeeding
- mechanism of action**
 - benzodiazepines: potentiate binding of GABA to its receptors; results in decreased neuronal activity
 - bupirone: partial agonist of 5-HT_{1A} receptors

Benzodiazepines

- should be used for limited periods (weeks-months) to avoid dependence
- all benzodiazepines are sedating; be wary with use in the elderly
- have similar efficacy, so choice depends on half-life, metabolites and route of administration, OD or bid
- taper slowly over weeks-months because they can cause withdrawal reactions
 - low dose withdrawal: tachycardia, HTN, panic, insomnia, anxiety, impaired memory and concentration, perceptual disturbances
 - high dose withdrawal: hyperpyrexia, seizures, psychosis, death
- avoid alcohol because of potentiation of CNS depression; caution with drinking and driving/machinery use
- side effects**
 - CNS: drowsiness, cognitive impairment, reduced motor coordination, memory impairment
 - physical dependence, tolerance
- withdrawal**
 - symptoms: anxiety, insomnia, autonomic hyperactivity (less common)
 - onset: 1-2 d (short-acting), 2-4 d (long-acting)
 - duration: weeks-months
 - complications with above 50 mg diazepam/day: seizures, delirium, arrhythmias, psychosis
 - management: taper with long-acting benzodiazepine
 - similar to but less severe than alcohol withdrawal; can be fatal
- overdose**
 - commonly used drug in overdose
 - overdose is rarely fatal
 - benzodiazepines are more dangerous and may cause death when combined with alcohol, other CNS depressants or TCAs

Benzodiazepines used for Alcohol Withdrawal

- Diazepam 20 mg PO/IV q1h prn
- Lorazepam 2-5 mg PO/IV/SL for patients with liver disease, chronic lung disease, or elderly

Benzodiazepine Antagonist – Flumazenil (Anexate®)

- use for suspected benzodiazepine overdose
- specific antagonist at the benzodiazepine receptor site

Table 22. Common Anxiolytics

Class	Drug	Dose Range (mg/d)	t _{1/2} (h)	Appropriate Use
Benzodiazepines				
Long-acting	clonazepam (Rivotril®)	0.25-4	18-50	Akathisia, generalized anxiety, seizure prevention, panic disorder
	diazepam (Valium®)	2-40	30-100	Generalized anxiety, seizure prevention, muscle relaxant, alcohol withdrawal
	chlordiazepoxide (Librium®)	5-300	30-100	Sleep, anxiety, alcohol withdrawal
	flurazepam (Dalmane®)	15-30	50-160	Sleep
Short-acting	alprazolam (Xanax®)	0.25-4.0	6-20	Panic disorder, high dependency rate
	lorazepam (Ativan®)	0.5-6.0	10-20	Sleep, generalized anxiety, akathisia, alcohol withdrawal, sublingual available for very rapid action
	oxazepam (Serax®)	10-120	8-12	Sleep, generalized anxiety, alcohol withdrawal
	temazepam (Restoril®)	7.5-30	8-20	Sleep
	triazolam (Halcion®)	0.125-0.5	1.5-5	Shortest t _{1/2} , rapid sleep, but rebound insomnia
Azapirones				
	zopiclone (Imovane®)	5-7.5	3.8-6.5	Sleep

**Benzodiazepines****LOT**

Lorazepam

Oxazepam

Temazepam

Safe for patients with impaired liver function because not metabolized by liver

Somatic Therapies

Electroconvulsive Therapy

- various methodological improvements have been made since the first treatment in 1938 to reduce adverse effects
- modern ECT: induction of a generalized seizure using an electrical pulse through scalp electrodes while the patient is under general anesthesia with a muscle relaxant
- considerations: unilateral vs. bilateral electrode placement, pulse rate, dose, number and spacing of treatments
- usual course is 6-12 treatments, 2-3 treatments per wk
- indications**
 - depression refractory to adequate pharmacological trial (MDD or Bipolar I depression)
 - high suicide risk
 - medical risk in addition to depression (dehydration, electrolytes, pregnancy)
 - previous good response to ECT
 - familial response to ECT
 - elderly
 - psychotic depression
 - catatonic features
 - marked vegetative features
 - acute schizophrenia unresponsive to medication
 - mania unresponsive to medications
 - OCD refractory to conventional treatment
- side effects:** risk of anesthesia, memory loss (may be retrograde and/or anterograde, tends to resolve by 6-9 mo, permanent impairment controversial), headaches, myalgias
 - unilateral ECT causes less memory loss than bilateral but may not be as effective
- contraindications:** increased intracranial pressure, recent (<2 wk) MI (not absolute but requires special monitoring)

Repetitive Transcranial Magnetic Stimulation (rTMS)

- noninvasive production of focal electrical currents in select brain areas using magnetic induction
- indications:** strong evidence for treatment-resistant depression, pain disorders; possibly efficacious for anxiety disorders, eating disorders, substance use disorders
- adverse effects:** common – transient local discomfort, hearing issues, cognitive changes; rare – seizure, syncope, mania induction

Magnetic Seizure Therapy (MST)

- seizure induction by magnetic current induction rather than direct stimulation
- early studies demonstrate efficacy for depression as well as anxiety, reduced memory side effects vs. ECT

**ECT in Society**

Prior to the 1940's, ECT was performed without the use of muscle relaxants, resulting in seizures with full-scale convulsions and rare but serious complications such as vertebral and long-bone fractures. This practice may have led to negative societal perceptions of ECT, further perpetuated by barbaric depictions in popular culture. Despite ongoing stigmatization, ECT as it is practiced today is an effective and safe option for patients struggling with mental illness

**Efficacy of ECT in Depression: A Meta-Analytic Review**

J of ECT 2004; 20:13-20

Purpose: To analyze the efficacy of electroconvulsive therapy (ECT) in depression.

Methods: Meta-analysis of randomized and non-randomized control trials, comparing ECT to simulated ECT and placebo in individuals with a diagnosis of unipolar or bipolar depression. Main outcome was the Hamilton Depression Rating scale.

Results: ECT was found to be superior to simulated ECT, placebo, tricyclic antidepressants (TCAs), monoamine oxidase inhibitors (MAOIs), and antidepressants in general.

Conclusion: ECT is an valid treatment modality, including in severe and treatment-resistant depression cases.

Neurosurgical Treatments

Ablative/Lesion Procedures

- used for intractable MDD or OCD, efficacy ranges from 25-75% depending on procedure
- adverse effects:** related to lesion location and size, high risk of suicide in those who are not helped by surgery

Deep Brain Stimulation

- placement of small electrode leads in specific brain areas to alter neuronal signaling, usually for intractable MDD
- response rates (>50% symptom reduction) of 40-70%, adverse effects related to surgical risks and poor treatment response

Vagus Nerve Stimulation

- direct, intermittent electrical stimulation of left cervical vagus nerve via implanted pulse generator
- used for chronic, recurrent MDD that has failed previous therapy and ECT; slow onset, approximately 30% response rate at 1 yr

Other Therapy Modalities

Phototherapy (Light Box Therapy)

- bright light source exposure, best in morning, for 30-60 min (usually 10 000 lux)
- proposed mechanisms: reverses pathological alterations in circadian rhythm through action on suprachiasmatic nucleus
- indications:** SAD, non-seasonal depression (as augmentation), sleep disorders
- adverse effects:** mania induction, reaction with photosensitizing drug or photosensitive eye or skin conditions

Aerobic Exercise

- moderate-intense aerobic exercise is associated with acute increased secretion of serotonin, phenethylamine, BDNF, endogenous opioids and cannabinoids (likely this combination is what contributes to the "runner's high")
- long term increases grey matter in multiple areas, as well as improvements in cognition, memory, and stress tolerance
- indications:** Monotherapy for mild-moderate MDD, Adjunctive therapy for moderate-severe MDD; research suggests 30 min of supervised moderate-intensity exercise at least 3 times weekly for a minimum of 9 wk is effective
- may be helpful in PTSD, schizophrenia

Canadian Legal Issues

Common Forms

Table 23. Common Forms Under the *Mental Health Act* (in Ontario)

Form	Who Signs	When	Expiration Date	Right of Patient to Review Board Hearing	Options Before Form Expires
Form 1: Application by physician to hospitalize a patient for psychiatric assessment against his/her will to a schedule 1 facility (Form 42 given to patient)	Any MD	Within 7 d after examination of the patient	72 h after hospitalization Void if not implemented within 7 d	No	Form 3 + 30 or voluntary admission or Send home ± follow-up
Form 2: Order for a psychiatric assessment against his/her will which is ordered by Justice of the Peace	Justice of the Peace	No statutory time restriction	7 d from when completed Purpose of form is complete once patient brought to hospital	No	Form 1 + 42 or Send home ± follow-up
Form 3: Certificate of involuntary admission to a schedule 1 facility (Form 30 given to patient, notice to rights advisor)	Attending MD (different than MD who completed Form 1)	Before expiration of Form 1 Any time to change status of a voluntary patient	14 d	Yes	Form 4 + 30 or Voluntary admission (Form 5)
Form 4: Certificate of renewal of involuntary admission to a schedule 1 facility (original Form 30 given to patient, notice to rights advisor)	Attending MD following patient on Form 3	Prior to expiration of Form 3	First: 1 mo Second: 2 mo Third: 3 mo (max)	Yes	Form 4 + 30 or Voluntary admission (Form 5)

Form 1: Application for Psychiatric Assessment

- Filled out when a patient is suspected of being an imminent harm to themselves (suicide) or others (homicide) or when they are incapable of self-care (e.g. not dressed for freezing weather) and are suffering from an apparent mental disorder
- Based on any combination of the physician's own observations and facts communicated by others
- Box A or Box B completed
- Box A:** Serious Harm Test
- The Past/Present Test assesses current behaviours/threats/attempts
- The Future Test assesses the likelihood of serious harm occurring as a result of the presenting mental disorder. In this section, one should document evidence of the mental disorder and concerning behaviour/thoughts
- Box B:** Patients with a known mental disorder, who are incapable of consenting to treatment (substitute decision-maker needed), have previously received treatment and improved, and are currently at risk of serious harm due to the same mental disorder

Table 23. Common Forms Under the *Mental Health Act* (in Ontario) continued

Form	Who Signs	When	Expiration Date	Right of Patient to Review Board Hearing	Options Before Form Expires
Form 5: Change to informal/voluntary status	Attending MD following patient on Form 3/4	Whenever deemed appropriate	N/A	N/A	N/A
Form 30: Notice to patient that they are now under involuntary admission on either Form 3 or 4. Original to the patient, copy to chart	Attending MD	Whenever Form 3 or Form 4 filled	N/A	Yes	N/A
Form 33: Notice to patient that patient is incapable of consenting to treatment of mental disorder, and/or management of property and/or disclosure of health information (original copy to patient)	Attending MD	Whenever deemed appropriate	N/A	Yes	N/A

* Schedule 1 Facilities: Able to provide intensive inpatient and outpatient care

Consent

- see [Ethical, Legal, and Organizational Medicine, ELOM7](#)

Community Treatment Order (CTO)

- purpose: a CTO orders a person suffering from a serious mental disorder to receive treatment and supervision in the community. Based on a comprehensive plan outlining medications, appointments, and other care believed necessary to allow the person to live in the community (vs. in a psychiatric facility, where things are more restrictive)
- intended for those who:
 - due to their serious mental disorder, experience a pattern of admission to a psychiatric facility where condition is usually stabilized
 - after being released, these patients often lack supervision and stop treatment, leading to destabilization
 - due to the destabilization of their condition, these patients usually require re-admission to hospital
 - if CTO violated (e.g. treatment not taken), patient brought in by police to hospital for treatment as per CTO
- criteria for a physician to issue a CTO
 - patient with a prior history of hospitalization
 - a community treatment plan for the person has been made
 - examination by a physician within the previous 72 h before entering into the CTO plan
 - ability of the person subject to the CTO to comply with it
 - consultation with a rights advisor and consent of the person or the person's substitute decision maker
- CTOs are valid for 6 mo unless they are renewed or terminated at an earlier date such as
 - where the person fails to comply with the CTO
 - when the person or his/her substitute decision-maker withdraws consent to the community treatment plan
- CTO process is consent-based and all statutory protections governing informed consent apply
- the rights of a person subject to a CTO include
 - the right to a review by the Consent and Capacity Board with appeal to the courts each time a CTO is issued or renewed
 - a mandatory review by the Consent and Capacity Board every second time a CTO is renewed
 - the right to request a re-examination by the issuing physician to determine if the CTO is still necessary for the person to live in the community
 - the right to review findings of incapacity to consent to treatment
 - provisions for rights advice

CTO Legislation

- Ontario passed CTO legislature on December 1, 2000 (known as "Brian's Law")
- Similar CTOs have been implemented in Saskatchewan (1995), Manitoba (1997), and British Columbia (1999)

CVP	central venous pressure						

Approach to the Respiratory Patient

Basic Anatomy Review

Figure 1. Lung lobes and bronchi

Respiration Pattern

Normal

Obstructive (prolonged expiration)
 • Asthma, COPD

Bradypnea (slow respiratory rate)
 • Drug-induced respiratory depression
 • Diabetic coma (nonketotic)
 • Increased ICP

Kussmaul's Breathing (fast and deep)
 • Metabolic acidosis
 • Exercise
 • Anxiety

Biot's/Ataxic (irregular with long apneic periods)
 • Drug-induced respiratory depression
 • Increased ICP
 • Brain damage (especially medullary)

Cheyne-Stokes Breathing (changing rates and depths with apneic periods)
 • Drug-induced respiratory depression
 • Brain damage (especially cerebral)
 • CHF
 • Uremia

Apneustic (prolonged inspiratory pause)
 • Pontine lesion

© Bonnie Tang 2012

Figure 2. Respiration patterns in normal and disease states

Differential Diagnoses of Common Presentations

Table 1. Differential Diagnosis of Dyspnea

ACUTE DYSPNEA (MINUTES-DAYS)
Cardiac
Acute myocardial infarction
CHF exacerbation
Cardiac tamponade
Coronary artery disease
Arrhythmia
Pulmonary
Upper airway obstruction (anaphylaxis, aspiration, croup, EBV)
Airway disease (asthma, COPD exacerbation, bronchitis)
Parenchymal lung disease (ARDS, pneumonia)
Pulmonary vascular disease (PE, vasculitis)
Pleural disease (pneumothorax, tension pneumothorax)
Neurologic/Psychogenic
Respiratory control (metabolic acidosis, trauma)
Anxiety
Panic attack
CHRONIC DYSPNEA (+4 WEEKS)
Cardiac
Valvular heart disease
Myocardial dysfunction (decreased CO)
Pulmonary
Airway disease (asthma, COPD)
Parenchymal lung disease (interstitial disease)
Pulmonary vascular disease (pulmonary HTN, vasculitis)
Pleural disease (effusion)
Metabolic
Medication
Severe Anemia
Hyperthyroidism
Neuromuscular and chest wall disorders
Deconditioning, obesity, pregnancy, neuromuscular disease
Psychogenic
Anxiety

Table 3. Differential Diagnosis of Hemoptysis

Airway Disease
Acute or chronic bronchitis*
Bronchiectasis
Bronchogenic CA
Bronchial carcinoid tumour
CF
Parenchymal Disease
Pneumonia
TB
Lung abscess
Fungal infection
Primary lung cancer
Pulmonary metastasis
Vascular Disease
PE
Elevated pulmonary venous pressure:
LVF
Mitral stenosis
Vascular malformation
Vasculitis
Goodpasture's syndrome
Idiopathic pulmonary hemosiderosis
Miscellaneous
Impaired coagulation
Pulmonary endometriosis

*Most common cause of hemoptysis

Ribs	
Rheumatic disease	
Psych	
Anxiety	
Panic attack/disorder	

Table 4. Differential Diagnosis of Cough

Airway Irritants
Inhaled smoke, dusts, fumes
Postnasal drip (upper airway cough syndrome)
Aspiration
Gastric contents (GERD)*
Oral secretions
Foreign body
Airway Disease
URTI including postnasal drip and sinusitis*
Acute or chronic bronchitis
Bronchiectasis
Neoplasm
External compression by node or mass lesion
Asthma*
COPD
Parenchymal Disease
Pneumonia
Lung abscess
Interstitial lung disease
PE
CHF
Drug-induced (e.g. ACEI)
Smoking

*"Big Three" causes of chronic cough

Figure 3. Signs of nail clubbing

Signs of Respiratory Distress

- Tachypnea
- Central/peripheral cyanosis
- Tachycardia
- Inability to speak
- Nasal flaring
- Tracheal tug
- Intercostal indrawing
- Tripoding
- Abdominal breathing (paradoxical breathing)

Common Causes of Clubbing

- Pulmonary: Lung CA, bronchiectasis, pulmonary fibrosis, abscess, CF, TB, empyema, A-V fistula/malformation (NOT COPD)
- Cardiac: Cyanotic congenital heart disease, endocarditis
- GI: IBD, celiac, cirrhosis, neoplasm
- Endocrine: Graves' disease
- Other: Other malignancy, primary hypertrophic osteoarthropathy

Clubbing is not seen in COPD – if present, think malignancy

Hemoptysis

- Most common cause is bronchitis
- 90% of massive hemoptysis is from the bronchial arteries
- Considered "massive" if >600 mL/24 h or bleeding rate of >100 mL/h

Most Common Causes of Chronic Cough in the Non-smoking Patient (cough >3 mo with normal CXR)

- GERD
- Asthma
- Postnasal drip
- ACEI

Pulmonary Function Tests

- useful in differentiating the pattern of lung disease (obstructive vs. restrictive)
- assess lung volumes, flow rates, and diffusion capacity
- **note:** normal values for FEV₁ are approximately ±20% of the predicted values (for age, sex, and height); ethnicity may affect predicted values

Table 5. Comparison of Lung Flow and Volume Parameters in Lung Disease

	Obstructive	Restrictive
	Decreased flow rates (most marked during expiration)	Decreased lung compliance
	Air trapping (increased RV/TLC)	Decreased lung volumes
	Hyperinflation (increased FRC, TLC)	
DDx	Asthma, COPD, CF, bronchiolitis, bronchiectasis*	ILD, pleural disease, neuromuscular disease, chest wall disease
FEV₁/FVC	↓	↑ or N
TLC	↑ or N	↓
RV	↑ or N	↓
RV/TLC	↑ or N	N
DL_{CO}	↓/↑ or N	↓ or N

*Bronchiectasis can be obstructive or mixed

Table 6. Common Respiriology Procedures

Technique	Purpose	Description
Plethysmography ("body box")	Measure FRC	After a normal expiration the patient inhales against a closed mouthpiece Resultant changes in the volume and pressure of the plethysmograph are used to calculate the volume of gas in the thorax Useful for patients with air trapping
He Dilution	Measure FRC	A patient breathes from a closed circuit containing a known concentration and volume of helium Since the amount of helium remains constant, FRC is determined based on the final concentration of the helium in the closed system Only includes airspaces that communicate with the bronchial tree
Bronchoscopy	Diagnosis and therapy	A flexible or rigid bronchoscope is used for visualization of a patient's airways. Allows for: Bronchial and broncho-alveolar lavage (washings) for culture and cytology Endobronchial or transbronchial tissue biopsies Removal of secretions/foreign bodies/blood Laser resections Airway stenting Mediastinal lymph nodes can also be sampled using a special bronchoscope equipped with an U/S probe (EBUS)

Figure 4A. Lung volumes and capacities

Figure 4B. Expiratory flow volume curves
Adapted with permission from Elsevier. Weinberger SE. Principles of pulmonary medicine, 5th ed. 2008

- Lung Volumes**
- ERV – Expiratory Reserve Volume
 - FEF – Forced Expiratory Flow Rate
 - FEV₁ – Forced Expiratory Volume (in one second)
 - FRC – Functional Residual Capacity
 - IC – Inspiratory Capacity
 - RV – Residual Volume
 - TLC – Total Lung Capacity
 - VC – Vital Capacity
 - V_T – Tidal Volume

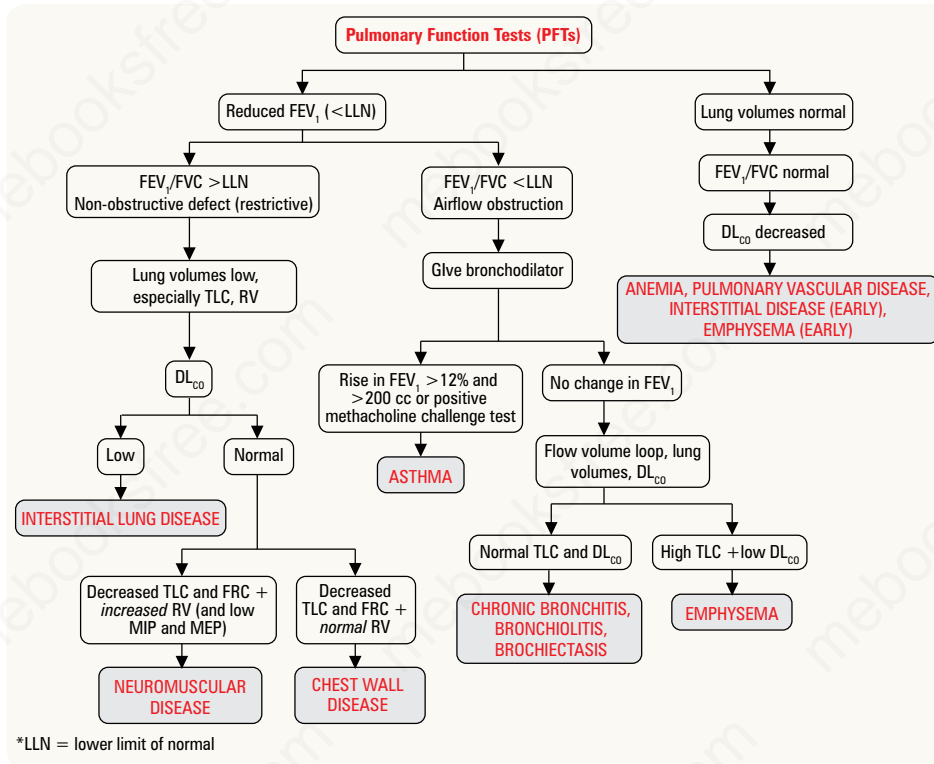

Figure 5. Interpreting PFTs

Chest X-Rays

- see [Medical Imaging, MI4](#)

Table 7. CXR Patterns and Differential Diagnosis

Pattern	Signs	Common DDX
Consolidation ("Airspace disease")	Air bronchogram Silhouette sign Less visible blood vessels	Acute: water (pulmonary edema), pus (pneumonia), blood (hemorrhage) Chronic: neoplasm (lymphoma), inflammatory (eosinophilic pneumonia), infection (TB, fungal)
Reticular ("Interstitial disease")	Increased linear markings Fine or ground glass Honeycombing (IPF)	ILD (IPF, collagen vascular disease, asbestos, drugs), hypersensitivity pneumonitis, asbestosis, collagen vascular disease, drug reactions
Nodular	Cavitary vs. non-cavitary	Cavitary: neoplasm (primary vs. metastatic lung cancer), infectious (anaerobic or Gram negative, TB, fungal), inflammatory (RA, sarcoidosis, granulomatosis with polyangiitis [GPA]), IPF Non-cavitary: above + sarcoidosis, Kaposi's sarcoma (in HIV), silicosis and other pneumoconioses

Arterial Blood Gases

- provides information on acid-base and oxygenation status
- see [Nephrology, NP15](#)

Approach to Acid-Base Status

1. Is the pH acidemic (pH <7.35), alkalemic (pH >7.45), or normal (pH 7.35-7.45)?
2. What is the primary disturbance?
 - metabolic: change in HCO₃⁻ and pH in same direction
 - respiratory: change in HCO₃⁻ and pH in opposite directions
3. Is there appropriate compensation? (see [Table 8](#))
 - metabolic compensation occurs over 2-3 d reflecting altered renal HCO₃⁻ production and excretion
 - respiratory compensation through ventilatory control of P_aCO₂ occurs immediately
 - inadequate compensation may indicate a second acid-base disorder

Figure 6. Oxygen-Hb dissociation curve

Table 8. Expected Compensation for Specific Acid-Base Disorders

Disturbance	P _a CO ₂ (mmHg) (normal ~40)	HCO ₃ ⁻ (mmHg) (normal ~24)
Respiratory Acidosis		
Acute	↑ 10	↑ 1
Chronic	↑ 10	↑ 3
Respiratory Alkalosis		
Acute	↓ 10	↓ 2
Chronic	↓ 10	↓ 5
Metabolic Acidosis	↓ 1	↓ 1
Metabolic Alkalosis	↑ 5-7	↑ 10

- if there is metabolic acidosis, what is the anion gap and osmolar gap?
 - anion gap = $[Na^+] - ([Cl^-] + [HCO_3^-])$; normal $\leq 10-15$ mmol/L
 - osmolar gap = measured osmolarity - calculated osmolarity = measured - $(2[Na^+] + \text{glucose} + \text{urea})$; normal ≤ 10 mmol/L
- if anion gap is increased, is the change in bicarbonate the same as the change in anion gap?
 - if not, consider a mixed metabolic picture

Table 9. Differential Diagnosis of Respiratory Acidosis

<i>Increased P_aCO₂ secondary to hypoventilation</i>			
Respiratory Centre Depression (Decreased RR)	Neuromuscular Disorders (Decreased Vital Capacity)	Lung Disease	Mechanical Hypoventilation (Inadequate Mechanical Ventilation)
Drugs (anesthesia, sedatives, narcotics) Trauma Encephalitis Stroke Central apnea Supplemental O ₂ in chronic CO ₂ retainers (e.g. COPD)	Myasthenia gravis Guillain-Barré syndrome Botulism Poliomyelitis Muscular dystrophies ALS Myopathies Chest wall disease (obesity, kyphoscoliosis)	COPD Asthma Pulmonary edema Pneumothorax Pneumonia ILD (late stage) ARDS	

Table 10. Differential Diagnosis of Respiratory Alkalosis

<i>Decreased P_aCO₂ secondary to hyperventilation</i>		
Pulmonary disease (pneumonia, edema, PE, interstitial fibrosis) Severe anemia Heart failure High altitude	Respiratory Centre Stimulation	Mechanical Hyperventilation (Excessive Mechanical Ventilation)
	Drugs (ASA, progesterone, theophylline, catecholamines, psychotropics, nicotine, salicylates) Chest wall disease (obesity, kyphoscoliosis) Hepatic failure Gram-negative sepsis Pregnancy Anxiety Pain	

- see [Nephrology, NP16](#) for differential diagnosis of metabolic acidosis and alkalosis

Factors that Shift the Oxygen-Hb Dissociation Curve to the Right

"CADET, face right!"

CO₂
Acid
2,3-DPG
Exercise
Temperature (increased)

Note: 2,3-DPG (2,3-diphosphoglycerate) is now called 2,3-BPG (2,3-biphosphoglycerate)

Acidosis ↔ Hyperkalemia
Alkalosis ↔ Hypokalemia

Note: Mixed acid-base disturbances can still have a "normal" pH

Osmolar Gap = measured osmolarity - calculated osmolarity; for calculated osmolarity think "2 salts and a sticky BUN" (2Na + glucose + urea)

Anion Gap Metabolic Acidosis

MUDPILES/CAT

Methanol
Uremia
Diabetic ketoacidosis/starvation ketoacidosis
Phenformin/Paraldehyde
Isoniazid, Iron, Ibuprofen
Lactic acidosis
Ethylene glycol
Salicylates
Cyanide, Carbon dioxide
Alcoholic ketoacidosis
Toluene, Theophylline

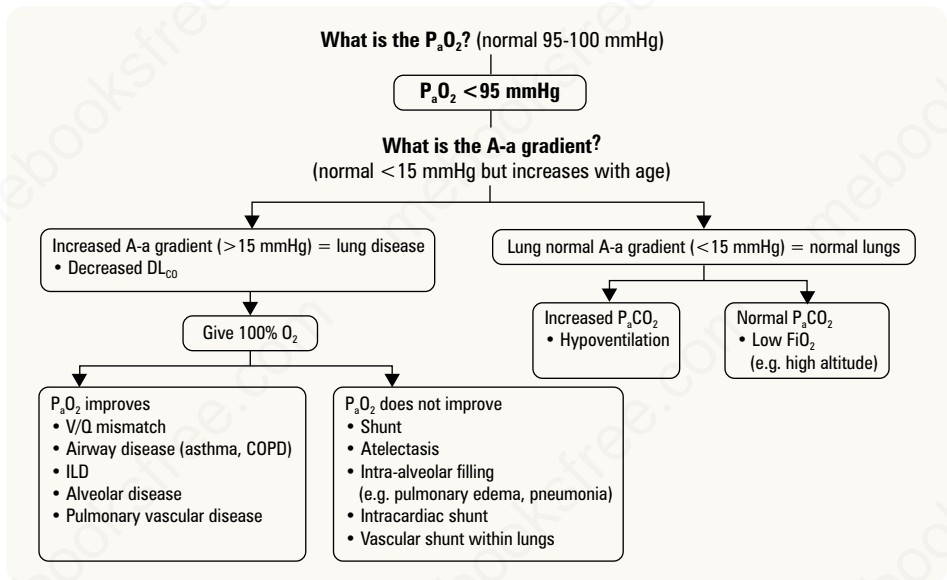

Figure 7. Approach to hypoxemia

Figure 8. Pathophysiology of V/Q mismatch

Figure adapted from West – Respiratory Physiology: The Essentials, 9th Ed. 2012. Lippincott Williams & Wilkins, Philadelphia, PA.

Airway Disease

Pneumonia

- see [Infectious Diseases, ID7](#)

Asthma

- see [Family Medicine, FM16](#) and [Pediatrics, P82](#)

Definition

- chronic inflammatory disorder of the airways resulting in episodes of reversible bronchospasm causing airflow obstruction
- associated with reversible airflow limitation and airway hyper-responsiveness to endogenous or exogenous stimuli

Epidemiology

- common, 7-10% of adults, 10-15% of children
- most children with asthma significantly improve in adolescence
- often family history of atopy (asthma, allergic rhinitis, eczema)
- occupational asthma (organic allergens, isocyanates, animals, etc.)

At Sea Level on Room Air

$FI_{O_2} = 0.21$
 $P_{atm} = 760$ mmHg
 $PH_2O = 47$ mmHg
 $RQ = 0.8$
 Thus, A-a DO_2 Gradient on Room Air
 $A-aDO_2 = (150 - 1.25 (P_aCO_2)) - P_aO_2$

Diffusion Capacity for CO

DL_{CO} decreases in/with:

- Interstitial lung disease
- Pulmonary vascular disease
- Anemia
- Emphysema (decreased surface area)

DL_{CO} increases in/with:

- Asthma
- Obesity
- Pulmonary hemorrhage
- Left-to-right intracardiac shunt
- Polycythemia
- Postexercise physiology (increased pulmonary blood volume)

Pulmonary Shunt

Occurs when the capillary networks of the alveoli are perfused, yet there is a lack of adequate ventilation (and thus oxygenation) in that alveolus or group of alveoli. Thus this blood enters the pulmonary venous system without being oxygenated

Airway Obstruction (decreased FEV₁)

- Asthma
- COPD (chronic bronchitis, emphysema)
- Bronchiectasis (obstructive or mixed)
- Cystic fibrosis (obstructive or mixed)

Red Flags

Severe tachypnea/tachycardia, respiratory muscle fatigue, diminished expiratory effort, cyanosis, silent chest, decreased LOC

Central cyanosis is not detectable until SaO_2 is <85%. It is more easily detected in polycythemia and less readily detectable in anemia

Pathophysiology

- airway obstruction → V/Q mismatch → hypoxemia → ↑ ventilation → ↓ P_aCO₂ → ↑ pH and muscle fatigue → ↓ ventilation, ↑ P_aCO₂/↓ pH

Signs and Symptoms

- dyspnea, wheezing, chest tightness, cough, sputum
- symptoms usually occur or worsen at night
- symptoms can be paroxysmal or persistent
- signs of respiratory distress
- pulsus paradoxus

Table 11. Criteria for Determining if Asthma is Well Controlled

Daytime symptoms <4 d/wk	No asthma-related absence from work/school
Night-time symptoms <1 night/wk	β ₂ -agonist use <4 times/wk
Physical activity unimpaired by symptoms	FEV ₁ or PEF >90% of personal best
Exacerbations mild, infrequent	PEF diurnal variation <10-15%

Adapted from: *Can Respir J* 2012; 19:127-164

Table 12. Pulmonary Function Criteria for Diagnosis of Asthma

Preferred Measurement	Alternative Measurements
Spirometry Showing Reversible Airway Obstruction (1) ↓ FEV ₁ /FVC below lower limit of normal Adults: <0.75 to 0.8 in adults Children age 6+: <0.8-0.9 AND (2) ↑ FEV ₁ ≥12% and, 200 mL in adults after bronchodilator or controller therapy	Peak Expiratory Flow Variability (1) ↓ in PEF after a bronchodilator or course of controller therapy Adults: PEF ↑ 60 L/min (min. 20%) OR Diurnal variation >8% for twice daily readings (20% for multiple daily readings) Children age 6+: PEF ↑ 20% Positive Challenge Test (1) Methacholine challenge: PCO ₂ <4 mg/mL (4-16 mg/mL is borderline; >16 mg/mL is negative) OR (2) Post-exercise: ↓ FEV ₁ ≥10-15%

Adapted from: *Can Respir J* 2012; 19:127-164

Treatment

- environment: avoid triggers
- patient education: features of the disease, goals of treatment, self-monitoring
- pharmacological
 - symptomatic relief in acute episodes: short-acting β₂-agonist, anticholinergic bronchodilators, inhaled corticosteroids, addition of a long acting β₂-agonist
 - long-term maintenance: inhaled/oral corticosteroids, anti-allergic agents, long-acting β₂-agonists (do not use LABA alone), long-acting anticholinergics, methylxanthine, LTRA, anti-IgE antibodies (e.g. omalizumab), anti-IL5 drugs (e.g. mepolizumab)

Emergency Management of Asthma

- see [Emergency Medicine, ER29](#)
- 1. inhaled β₂-agonist first line (MDI route and spacer device recommended)
- 2. systemic steroids (PO or IV if severe)
- 3. if severe add anticholinergic therapy ± magnesium sulfate
- 4. rapid sequence intubation in life-threatening cases (plus 100% O₂, monitors, IV access)
- 5. SC/IV adrenaline if caused by anaphylaxis, IV salbutamol if unresponsive
- 6. corticosteroid therapy at discharge

Asthma Triggers

- URTIs
- Allergens (pet dander, house dust, moulds, cockroach)
- Irritants (cigarette smoke, air pollution)
- Drugs (NSAIDs, β-blockers)
- Preservatives (sulphites, MSG)
- Other (emotion/anxiety, cold air, exercise, GERD)

Signs of Poor Asthma Control

"DANGERS"

- Daytime Sx ≥4 times/wk
- Activities reduced
- Nighttime Sx ≥1 time/wk
- GP visits
- ER visits
- Rescue puffer (SABA) use ≥4 times/wk
- School and work absences

Asthma Action Plan

Is a written plan developed by patients and their physicians which includes signs and symptoms for patients to recognize their current level of respiratory distress (denoted as 'green', 'yellow', or 'red/emergency' zones) and the personalized treatment options for each zone

Guidelines for Asthma Management

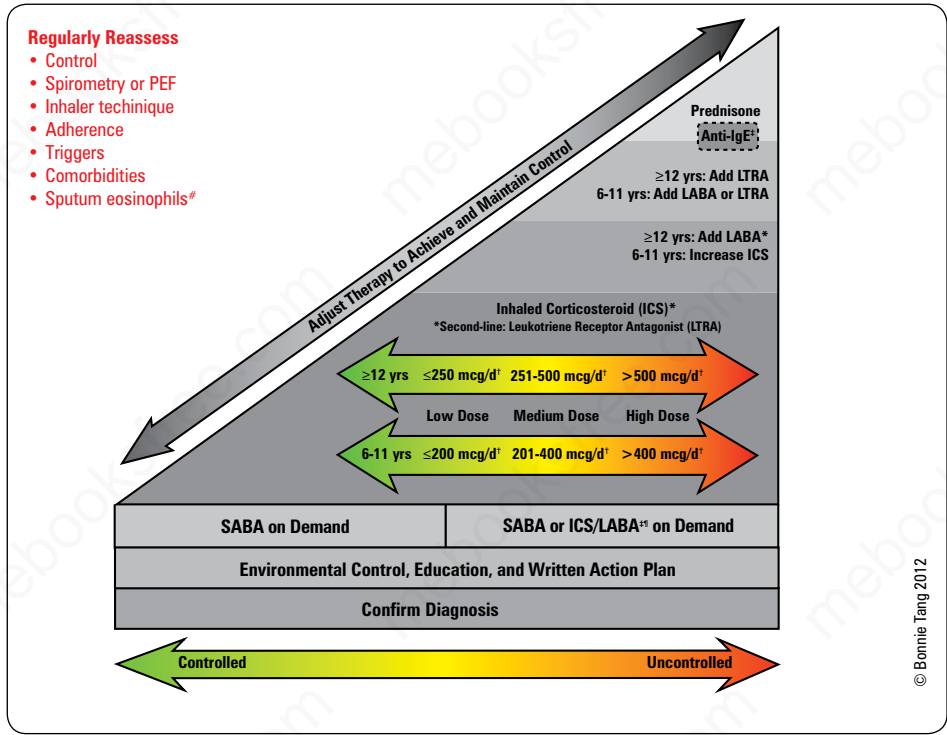

Figure 9. Guidelines for asthma management
Adapted from: *Can Respir J* 2012;19:127-164

Consider LABA for night-time symptoms

LTRA in Addition to Usual Care for Acute Asthma in Adults and Children
Cochrane DB Syst Rev 2012;CD006100

Purpose: To determine if the addition of LTRA is beneficial to patients with acute asthma receiving inhaled bronchodilators and systemic corticosteroids.

Methods: RCTs in Cochrane Airway Group's Specialised Register of trials that compared LTRA and standard vs. placebo and standard in people with acute asthma of any age.

Results: 8 trials, 1,470 adults and 470 children. For oral treatment, no significant difference between LTRAs and control in hospital admission (RR 0.86; 95% CI 0.21-3.52) or requirement for additional care (RR 0.87; 95% CI 0.60-1.68). LTRAs improved FEV₁ in adults (mean difference 0.08; 95% CI 0.01-0.14) but not in children. No significant difference in adverse events between LTRAs and control (RR 0.81; 95% CI 0.22-2.99). Similar results were found for intravenous treatment.

Conclusions: Currently, there is no evidence to support routine use of LTRAs in acute asthma.

Natural Progression of COPD

40s Chronic productive cough, wheezing occasionally

50s 1st acute chest illness

60s Dyspnea on exertion, increasing sputum, more frequent exacerbations

Late Stage Hypoxemia with cyanosis, polycythemia, hypercapnia (morning headache), cor pulmonale, weight loss

Complications of COPD

- Polycythemia 2° to hypoxemia
- Chronic hypoxemia
- Pulmonary HTN from vasoconstriction
- Cor pulmonale
- Pneumothorax due to rupture of emphysematous bullae
- Depression
- Bacterial infections

CO₂ Retainers

On ABG, retainers have chronically elevated CO₂ levels with a normal pH. Maintain O₂ Sat between 88-92% to prevent Haldane effect, worsening V/Q mismatch, and decreased respiratory drive

Remember, first line therapy for COPD is smoking cessation

α-1-Antitrypsin Deficiency

Inherited disorder of defective production of α-1-antitrypsin, a protein produced by hepatocytes. Acts in the alveolar tissue by inhibiting the action of proteases from destroying alveolar tissue. When deficient, proteases can destroy lung alveoli resulting in emphysema

Chronic Obstructive Pulmonary Disease

• see [Family Medicine, FM16](#)

Definition

- progressive and irreversible condition of the lung characterized by chronic obstruction to airflow with many patients having periodic exacerbations, gas trapping, lung hyperinflation, and weight loss
- 2 subtypes: chronic bronchitis and emphysema (usually coexist to variable degrees)
- gradual decrease in FEV₁ over time with episodes of acute exacerbations

Table 13. Clinical and Pathologic Features of COPD*

Chronic Bronchitis	Emphysema
Defined Clinically Productive cough on most days for at least 3 consecutive months in 2 successive years Obstruction is due to narrowing of the airway lumen by mucosal thickening and excess mucus	Defined Pathologically Dilation and destruction of air spaces distal to the terminal bronchiole without obvious fibrosis Decreased elastic recoil of lung parenchyma causes decreased expiratory driving pressure, airway collapse, and air trapping
	2 Types
	1) Centriacinar (respiratory bronchiole) Typical form seen in smokers, primarily affects upper lung zones
	2) Panacinar (all parts of acinus) Accounts for about 1% of emphysema cases α1-antitrypsin deficiency, primarily affects lower lobes

*Note that both chronic bronchitis and emphysema can exist without obstruction. Only if obstruction is also present is it termed COPD

Risk Factors

- smoking is #1 risk factor
- others
 - environmental: air pollution, occupational exposure, exposure to wood smoke or other biomass fuel for cooking
 - treatable factors: α1-antitrypsin deficiency, bronchial hyperactivity
 - demographic factors: age, family history of atopy, male sex, history of childhood respiratory infections, low socioeconomic status

Signs and Symptoms

Table 14. Clinical Presentation and Investigations for Chronic Emphysema

	Symptoms	Signs	Investigations
Bronchitis (Blue Bloater*)	Chronic productive cough Purulent sputum Hemoptysis	Cyanosis (2° to hypoxemia and hypercapnia) Peripheral edema from RVF (cor pulmonale) Crackles, wheezes Prolonged expiration if obstructive Frequently obese	PFT: ↓ FEV ₁ , ↓ FEV ₁ /FVC N TLC, ↓ or N DL _{CO} CXR: AP diameter normal ↑ bronchovascular markings Enlarged heart with cor pulmonale
Emphysema (Pink Puffer*)	Dyspnea (± exertion) Minimal cough Tachypnea Decreased exercise tolerance	Pink skin Pursed-lip breathing Accessory muscle use Cachectic appearance due to anorexia and increased work of breathing Hyperinflation/barrel chest, hyperresonant percussion Decreased breath sounds Decreased diaphragmatic excursion	PFT: ↓ FEV ₁ , ↓ FEV ₁ /FVC ↑ TLC (hyperinflation) ↑ RV (gas trapping) ↑ DL _{CO} CXR: ↑ AP diameter Flat hemidiaphragm (on lateral CXR) ↓ heart shadow ↑ retrosternal space Bullae ↓ peripheral vascular markings

*Note that the distinction between "blue bloaters" and "pink puffers" is more of historical than practical interest as most COPD patients have elements of both

Table 15. Treatment of Stable COPD

Treatment	Details
PROLONG SURVIVAL	
Smoking Cessation	Nicotine replacement, bupropion, varenicline
Vaccination	Influenza, pneumococcal vaccine
Home Oxygen	Prevents cor pulmonale and decreases mortality if used > 15h/d; indicated if (1) PaO ₂ < 55 mmHg or (2) PaO ₂ < 60 mmHg with cor pulmonale or polycythemia
SYMPTOMATIC RELIEF (no mortality benefit)	
Bronchodilators (mainstay of current drug therapy, used in combination)	Short-acting anticholinergics (e.g. ipratropium bromide) and short-acting β ₂ -agonists (e.g. salbutamol, terbutaline) SABAs: rapid onset but significant side effects at high doses (e.g. hypokalemia) Short-acting anticholinergics more effective than SABAs with fewer side effects but slower onset; take regularly rather than PRN LABAs (e.g. salmeterol, formoterol, indacaterol) and long-acting anticholinergics (e.g. tiotropium bromide, glycopyrronium bromide) More sustained effects for moderate to severe COPD Inhaled corticosteroid (ICS) + LABA combination (e.g. Advair®: fluticasone + salmeterol, Symbicort®: budesonide + formoterol) ICS/LABA increases effectiveness vs. LABA alone Theophylline: weak bronchodilator; limited evidence to suggest combination with bronchodilator Side effects: nervous tremor, nausea/vomiting/diarrhea, tachycardia, arrhythmias, sleep changes PDE4 inhibitor: roflumilast (Daxas®) anti-inflammatory medication useful in COPD with chronic bronchitis, severe airflow obstruction, frequent exacerbations
Corticosteroids	ICS monotherapy has been shown to increase the incidence of pneumonia in COPD; ICS should only be used with a LABA in combination in patients with a history of exacerbations Oral steroids are important when treating exacerbations; chronic systemic glucocorticoids are generally not recommended due to unfavourable benefit to risk ratio
Surgical	Lung volume reduction surgery (resection of emphysematous parts of lung, associated with higher mortality if FEV ₁ < 20%), lung transplant
Other	Patient education, eliminate respiratory irritants/allergens (occupational/environmental), exercise rehabilitation to improve physical endurance

GOLD Classification of the Severity of COPD
 GOLD 1 Mild FEV₁ ≥ 80% of predicted
 GOLD 2 Moderate 50% ≤ FEV₁ < 80% of predicted
 GOLD 3 Severe 30% ≤ FEV₁ < 50% of predicted
 GOLD 4 Very Severe FEV₁ < 30% of predicted

Remember to step down therapy to lowest doses which control symptoms/signs of bronchoconstriction

Influenza Vaccine for Patients with Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2006; 1:CD002733

Study: Cochrane Systematic Review. 11 RCTs included, 6 specifically in COPD patients.

Population: Six of the studies were done on COPD patients in particular, while the others were on elderly and high-risk individuals. Asthma patients were excluded.

Intervention: Live or inactivated virus vaccines vs. placebo.

Outcome: Exacerbation rates, hospitalizations, mortality, lung function and adverse effects.

Results: In patients with COPD, inactivated vaccine correlated with fewer exacerbations per vaccinated subject than placebo (weighted mean difference (WMD) -0.37, 95% CI -0.64 to -0.11). Inactivated vaccine resulted in fewer influenza-related infections than placebo (WMD 0.19, 95% CI 0.07-0.48). There was also an increased risk of local mild, transient adverse reactions with the vaccine.

Conclusions: There appears to be a reduction in influenza-related infections, as well as exacerbations in patients with COPD receiving the vaccine.

Systemic Corticosteroids for Acute Exacerbations of Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2014; CD001228

Study: Cochrane systematic review 16 studies.

Population: 1,787 patients with acute COPD exacerbations.

Intervention: Oral or parenteral corticosteroids vs. placebo.

Outcome: Treatment failure, risk of relapse, time to next COPD exacerbation, likelihood of adverse event, length of hospital stay, and lung function at end of treatment.

Results: Systemic corticosteroids reduced the risk of treatment failure by over half compared with placebo in nine studies (n = 917) with median treatment duration 14 d, odds ratio (OR) 0.48 (95% CI 0.35-0.67). The evidence was graded as high quality and it would have been necessary to treat nine people (95% CI 7-14) with systemic corticosteroids to avoid one treatment failure. There was moderate-quality evidence for a lower rate of relapse by one month for treatment with systemic corticosteroid in two studies (n = 415) (hazard ratio (HR) 0.78; 95% CI 0.63-0.97). Mortality up to 30 d was not reduced by treatment with systemic corticosteroid compared with control in 12 studies (n = 1,319; OR 1.00; 95% CI 0.60-1.66). FEV₁, measured up to 72 hours, showed significant treatment benefits (7 studies; n = 649; mean difference (MD) 140 mL; 95% CI 90-200); however, this benefit was not observed at later time points. The likelihood of adverse events increased with corticosteroid treatment (OR 2.33; 95% CI 1.59-3.43). The risk of hyperglycemia was significantly increased (OR 2.79; 95% CI 1.86-4.19). For general inpatient treatment, duration of hospitalization was significantly shorter with corticosteroid treatment (MD -1.22 d; 95% CI -2.26 to -0.18), with no difference in length of stay in the intensive care unit (ICU) setting. Comparison of parenteral versus oral treatment showed no significant difference in the primary outcomes of treatment failure, relapse or mortality or for any secondary outcomes.

Conclusion: There is high-quality evidence to support treatment of exacerbations of COPD with systemic corticosteroid by the oral or parenteral route in reducing the likelihood of treatment failure and relapse by 1 mo, shortening length of stay in hospital inpatients not requiring assisted ventilation in ICU and giving earlier improvement in lung function and symptoms. There is no evidence of benefit for parenteral treatment compared with oral treatment with corticosteroid on treatment failure, relapse or mortality. There is an increase in adverse drug effects with corticosteroid treatment, which is greater with parenteral administration compared with oral treatment.

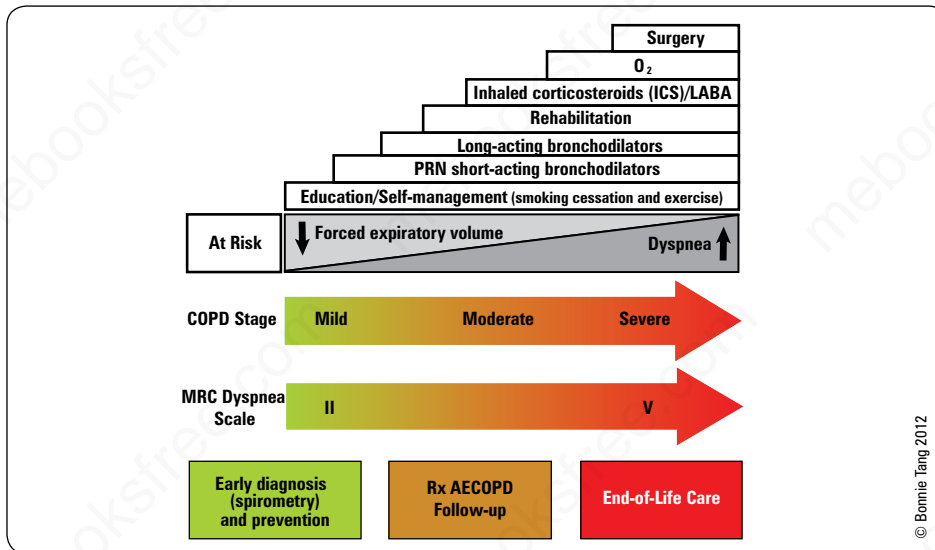

Figure 10. Guidelines for COPD management

Adapted from: Canadian Thoracic Society recommendations for management of chronic obstructive pulmonary disease. *Can Respir J* 2008;(Suppl A):15

Acute Exacerbations of COPD

• definition

- sustained (>48 h) worsening of dyspnea, cough, or sputum production leading to an increased use of medications
- in addition, defined as either purulent or non-purulent (to predict need for antibiotic therapy)

• etiology: viral URTI, bacteria, air pollution, CHF, PE, MI must be considered

• management

- ABCs, consider assisted ventilation if decreasing LOC or poor ABGs
- O₂: target 88-92% SaO₂ for CO₂ retainers
- bronchodilators by MDI with spacer or nebulizer
 - SABA + anticholinergic, e.g. salbutamol and ipratropium bromide via nebulizers × 3 back-to-back q15min
- systemic corticosteroids: IV solumedrol or oral prednisone
- antibiotics for exacerbations with increased sputum production and at least one of the following:
 - increased dyspnea or sputum purulence
 - simple exacerbation (no risk factors): amoxicillin, 2nd or 3rd generation cephalosporin, macrolide, or TMP/SMX
 - complicated exacerbation (one of: FEV₁ ≤50% predicted, ≥4 exacerbations per year, ischemic heart disease, home O₂ use, chronic oral steroid use): fluoroquinolone or β-lactam + β-lactamase inhibitor (amoxicillin/clavulanate)
- post exacerbation: rehabilitation with general conditioning to improve exercise tolerance

• ICU admission

- for life-threatening exacerbations
- ventilatory support
 - non-invasive: NIPPV, BiPAP
 - conventional mechanical ventilation

Prognosis in COPD

• prognostic factors

- level of dyspnea is the single best predictor
- development of complications, e.g. hypoxemia or cor pulmonale

• 5 yr survival

- FEV₁ <1 L = 50%
- FEV₁ <0.75 L = 33%

• BODE index for risk of death in COPD

- greater score = higher probability the patient will die from COPD; score can also be used to predict hospitalization
- 10 point index consisting of four factors:
 - Body mass index (BMI): <21 (+1 point)
 - Obstruction (FEV₁): 50-64% (+1), 36-49% (+2), <35% (+3)
 - Dyspnea (MRC scale): walks slower than people of same age on level surface, stops occasionally (+1), stops at 100 yards or a few minutes on the level (+2), too breathless to leave house or breathless when dressing/undressing (+3)
 - Exercise capacity (6 minute walk distance): 250-349 m (+1), 150-249 m (+2), <149 m (+3)

Pulmonary Embolism in Patients with Unexplained Exacerbation of COPD: Prevalence and Risk Factors

Ann Intern Med 2006;144:390-396

Study: Prospective cohort study of 211 patients with COPD (all current and former smokers) admitted to hospital for severe COPD exacerbation of unknown origin.

Measurements: All patients received spiral CT angiogram (CTA) and venous compression ultrasonography of both legs.

Results: 25% of patients met diagnostic criteria for PE (+ CTA or + U/S).

Conclusions: Prevalence of PE in patients hospitalized for COPD exacerbation of unknown origin is 25%. Therefore, all patients presenting to hospital with COPD exacerbation without obvious cause require PE workup (leg dopplers or CTA – decision of which to use depends on pre-test probability of the patient).

Non-Invasive Positive Pressure Ventilation for Treatment of Respiratory Failure due to Exacerbations of COPD

Cochrane DB Syst Rev 2004;CD004104

Study: Cochrane Systematic Review. 14 RCTs.

Population: 758 adult patients with COPD and acute respiratory failure due to COPD exacerbation.

Intervention: Usual medical care (UMC) and Non-invasive positive ventilation (NPPV) vs. UMC alone.

Primary Outcome: Treatment failure, mortality, and tracheal intubation.

Results: The risks for all primary outcomes were reduced with NPPV use: treatment failure (RR 0.48); mortality (RR 0.52); and intubation use (RR 0.61). Length of hospital stay was a significant mean 3.24 d shorter, but no difference between ICU length of stay. There is a small and significant improvement in pH (weight mean difference (WMD)=0.04), PaCO₂ (WMD=-0.40 kPa), and respiratory rate (WMD=-3.08 bpm) within 1 h post-treatment with NPPV. Complications associated with treatment were reduced in the NPPV treatment arm (RR 0.38).

Conclusion: For patients in respiratory failure due to a COPD exacerbation, NPPV is effective in reducing treatment failure, mortality, and need for intubation when used as a first line treatment adjunct to UMC.

Different Durations of Corticosteroid Therapy for Exacerbations of Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2014;CD006897

Study: Cochrane systematic review. 8 studies.

Population: 582 patients, with severe or very severe COPD.

Intervention: Corticosteroids given at equivalent daily doses for 3-7 d (short duration) vs. 10-15 d (longer-duration).

Outcome: Treatment failure, risk of relapse, time to next COPD exacerbation, likelihood of adverse event, length of hospital stay, and lung function at end of treatment.

Results: In four studies there was no difference in risk of treatment failure between short-duration and longer-duration systemic corticosteroid treatment (n = 457; odds ratio (OR) 0.72, 95% confidence interval (CI) 0.36-1.46), which was equivalent to 22 fewer per 1000 for short-duration treatment (95% CI 51 fewer to 34 more). No difference in risk of relapse (a new event) was observed between short-duration and longer-duration systemic corticosteroid treatment (n = 457; OR 1.04, 95% CI 0.70-1.56), which was equivalent to nine fewer per 1,000 for short-duration treatment (95% CI 68 fewer to 100 more). Time to the next COPD exacerbation did not differ in one large study that was powered to detect non-inferiority and compared five days versus 14 d of systemic corticosteroid treatment (n = 311; hazard ratio 0.95, 95% CI 0.66 to 1.37). In five studies no difference in the likelihood of an adverse event was found between short-duration and longer-duration systemic corticosteroid treatment (n = 503; OR 0.89, 95% CI 0.46-1.69, or nine fewer per 1000 (95% CI 44 fewer to 51 more)). Length of hospital stay (n = 421; mean difference (MD) -0.61 days, 95% CI -1.51-0.28) and lung function at the end of treatment (n = 185; MD FEV₁ -0.04 L; 95% CI -0.19-0.10) did not differ between short-duration and longer-duration treatment.

Conclusion: 5 d of oral corticosteroids is likely to be sufficient for treatment of adults with acute exacerbations of COPD, and this review suggests that the likelihood is low that shorter courses of systemic corticosteroids (of around five days) lead to worse outcomes than are seen with longer (10 to 14 d) courses.

Bronchiectasis

Definition

- irreversible dilatation of airways due to inflammatory destruction of airway walls resulting from persistently infected mucus
- usually affects medium sized airways
- P. aeruginosa* is the most common pathogen; *S. aureus*, *H. influenzae*, and nontuberculous mycobacteria also common

Table 16. Etiology and Pathophysiology of Bronchiectasis

Obstruction	Post-infectious (results in dilatation of bronchial walls)	Impaired Defenses (leads to interference of drainage, chronic infections, and inflammation)
Tumour	Pneumonia	Hypogammaglobulinemia
Foreign body	TB	CF
	Measles	Defective leukocyte function
	Pertussis	Ciliary dysfunction
	Allergic bronchopulmonary aspergillosis	(Kartagener's syndrome: bronchiectasis, sinusitis, situs inversus)
	Nontuberculous mycobacterium (NTM)	

Signs and Symptoms

- chronic cough, purulent sputum (but 10-20% have dry cough), hemoptysis (can be massive), recurrent pneumonia, local crackles (inspiratory and expiratory), wheezes
- clubbing
- may be difficult to differentiate from chronic bronchitis

Investigations

- PFTs: often demonstrate obstructive pattern but may be normal
- CXR
 - nonspecific: increased markings, linear atelectasis, loss of volume in affected areas
 - specific: "tram tracking" – parallel narrow lines radiating from hilum, cystic spaces, honeycomb like structures
- high-resolution thoracic CT (diagnostic, gold standard)
 - 87-97% sensitivity, 93-100% specificity
 - "signet ring": dilated bronchi with thickened walls where diameter bronchus > diameter of accompanying artery
- sputum cultures (routine + AFB)
- serum Ig levels
- sweat chloride if cystic fibrosis suspected (upper zone predominant)

Treatment

- vaccination: influenza and pneumococcal vaccination
- chest physiotherapy, breathing exercises, physical exercise
- antibiotics (oral, IV, inhaled): routinely used for mild exacerbations, driven by sputum sensitivity; macrolides may be used chronically for an anti-inflammatory effect
- inhaled antibiotics (tobramycin) used chronically to suppress *Pseudomonas* and reduce exacerbations
- mucolytics (e.g. hypertonic saline, N.B. DNase only in CF)
- inhaled corticosteroids: decrease inflammation and improve FEV₁; however, may increase risk of exacerbations
- oral corticosteroids for acute, major exacerbations
- pulmonary resection: in selected cases with focal bronchiectasis

Cystic Fibrosis

- see [Pediatrics, P82](#)

Pathophysiology

- chloride transport dysfunction: thick secretions from exocrine glands (lung, pancreas, skin, reproductive organs) and blockage of secretory ducts

Clinical Features

- results in severe lung disease, pancreatic insufficiency, diabetes, and azoospermia
- other manifestations: meconium ileus in infancy, distal ileal obstruction in adults, sinusitis, liver disease
- chronic lung infections
 - S. aureus*: early
 - P. aeruginosa*: most common
 - B. cepacia*: worse prognosis but less common
 - Aspergillus fumigatus*

Usually presents in childhood as recurrent lung infections that become persistent and chronic

Investigations

- Sweat chloride test
 - increased concentrations of NaCl and K+ ([Cl⁻] >60 mmol/L suggests diagnosis in children)
 - heterozygotes have normal sweat tests (and no symptoms)
- PFTs
 - early: airflow limitation in small airways
 - late: severe airflow obstruction, hyperinflation, gas trapping, decreased DL_{CO} (very late)
- ABGs
 - hypoxemia, hypercapnia later in disease with eventual respiratory failure and cor pulmonale
- CXR
 - hyperinflation, increased pulmonary markings (especially upper lobes)

Treatment

- chest physiotherapy and postural drainage
- pancreatic enzyme replacements, high calorie diet
- bronchodilators (salbutamol ± ipratropium bromide)
- inhaled mucolytic (reduces mucus viscosity), hypertonic saline DNase
- inhaled antibiotics (tobramycin, colistin, aztreonam)
- antibiotics (e.g. ciprofloxacin)
- CFTR potentiators (e.g Ivacaftor)
- lung transplant

Prognosis

- depends on: infections (cepacia colonization), FEV₁, acute pulmonary exacerbations, lung transplant vs. non-lung transplant
- female gender and low socioeconomic class have greater risk of early death

Interstitial Lung Disease

Definition

- a group of disorders which cause progressive scarring of lung tissue and impair lung function and gas exchange

Pathophysiology

- inflammatory and/or fibrosing process in the alveolar walls → distortion and destruction of normal alveoli and microvasculature
- typically associated with
 - lung restriction (decrease in TLC and VC)
 - decreased lung compliance (increased or normal FEV₁/FVC)
 - impaired diffusion (decreased DL_{CO})
 - hypoxemia due to V/Q mismatch (usually without hypercapnia until end stage)
 - pulmonary HTN and cor pulmonale occur with advanced disease secondary to hypoxemia and blood vessel destruction

Etiology

- >100 known disorders can cause ILD
- majority due to unknown agents or cause

In ILD think FASSTEN and BAD RASH

Upper Lung Disease (FASSTEN)
 Farmer's lung (hypersensitivity pneumonitis)
 Ankylosing spondylitis
 Sarcoidosis
 Silicosis
 TB
 Eosinophilic granuloma (Langerhans-cell histiocytosis)
 Neurofibromatosis

Lower Lung Disease (BAD RASH)
 Bronchiolitis obliterans with organizing pneumonia (BOOP)
 Asbestosis
 Drugs (nitrofurantoin, hydralazine, INH, amiodarone, many chemo drugs)
 Rheumatologic disease
 Aspiration
 Scleroderma
 Hamman Rich (acute interstitial pneumonia) and IPF

Table 17. Interstitial Lung Diseases

UNKNOWN ETIOLOGY	KNOWN ETIOLOGY		
Idiopathic interstitial pneumonias UIP (usual interstitial pneumonia e.g. IPF) NSIP (non-specific interstitial pneumonia) LIP (lymphocytic interstitial pneumonia) COP (cryptogenic organizing pneumonia e.g. BOOP) DIP (desquamative interstitial pneumonia) IPPFE (idiopathic pleuroparenchymal fibroelastosis) AFOP (acute fibrinous and organizing pneumonia) Sarcoidosis Langerhans-cell histiocytosis (eosinophilic granuloma) Lymphangioleiomyomatosis	ILD Associated with Systemic Rheumatic Disorders Scleroderma Rheumatoid arthritis SLE Polymyositis/dermatomyositis Anti-synthetase syndromes Mixed connective tissue disease Environment/Occupation Associated ILD Hypersensitivity pneumonitis (usually organic antigen) Farmer's lung Air conditioner/humidifier lung Bird breeder's lung Pneumoconioses (inorganic dust) Silicosis Asbestosis Coal worker's pneumoconiosis Chronic beryllium disease Pneumonitis from gases/fumes/vapour	ILD Associated with Drugs or Treatments Antibiotics (nitrofurantoin) Anti-inflammatory agents (methotrexate) Cardiovascular drugs (amiodarone) Antineoplastic agents (chemotherapy agents) Illicit drugs (e.g. crack lung, talc granulomatosis) Radiation ILD Associated with Pulmonary Vasculitis Granulomatosis with Polyangiitis (GPA) Goodpasture's syndrome Idiopathic pulmonary hemosiderosis	Inherited Disorders Familial IPF Telomerase mutations Neurofibromatosis Tuberous sclerosis Gaucher's disease Alveolar Filling Disorders Chronic eosinophilic pneumonia Pulmonary alveolar proteinosis

Signs and Symptoms

- dyspnea, especially on exertion
- nonproductive cough
- crackles (dry, fine, end-inspiratory)
- clubbing (especially in IPF and asbestosis)
- features of cor pulmonale
- note that signs and symptoms vary with underlying disease process
 - e.g. sarcoidosis is seldom associated with crackles and clubbing

Investigations

- CXR/high resolution CT (see [Medical Imaging, MI7](#))
 - usually decreased lung volumes
 - reticular, nodular, or reticulonodular pattern (nodular <3 mm)
 - hilar/mediastinal adenopathy (bilateral especially in sarcoidosis)
- PFTs
 - restrictive pattern: decreased lung volumes and compliance
 - normal or increased FEV₁/FVC (>70-80%), e.g. flow rates are often normal or high when corrected for absolute lung volume
 - DL_{CO} decreased due to V/Q mismatch (less surface area for gas exchange ± pulmonary vascular disease)
- ABGs
 - hypoxemia and respiratory alkalosis may be present with progression of disease
- other
 - bronchoscopy, bronchoalveolar lavage, lung biopsy
 - ESR, ANA (lupus), RF (RA), serum-precipitating antibodies to inhaled organic antigens (hypersensitivity pneumonitis), c-ANCA (GPA), anti-GBM (Goodpasture's)

The CXR can be normal in up to 15% of patients with interstitial lung disease

Unknown Etiologic Agents

IDIOPATHIC PULMONARY FIBROSIS

Definition

- pulmonary fibrosis of unknown cause with usual interstitial pneumonia (UIP) histology (found on biopsy or inferred from CT)
- a progressive, irreversible condition
- DDx: NSIP, COP, desquamative interstitial pneumonitis (DIP), lymphocytic interstitial pneumonitis (LIP), Sjögren's disease

Signs and Symptoms

- commonly presents over age 50, incidence rises with age; males > females
- dyspnea on exertion, nonproductive cough, constitutional symptoms, late inspiratory fine crackles at lung bases, clubbing

Investigations

- labs (nonspecific, autoimmune serology usually negative)
- CXR: reticular or reticulonodular pattern with lower lung predominance; often see honeycombing in advanced disease
- high resolution CT: lower zone peripheral reticular markings, traction bronchiectasis, honeycombing; ground glass, consolidation, or nodules should not be prominent in IPF
- biopsy: rarely for UIP as honeycombing usually makes radiologic diagnosis possible

Treatment

- O₂
- pirfenidone and nintedanib can slow disease progression
- lung transplantation for advanced disease
- mean survival of 3-5 yr after diagnosis

SARCOIDOSIS

Definition

- idiopathic non-infectious granulomatous multi-system disease with lung involvement in 90%
- characterized pathologically by non-caseating granulomas
- numerous HLA antigens have been shown to play a role and familial sarcoidosis is now recognized

Epidemiology

- typically affects young and middle-aged patients
- higher incidence among people of African descent and from northern latitudes e.g. Scandinavia, Canada

IPF Prevalence

- Age 35-44: 2-7 per 100,000
- Age >75: 175 per 100,000

Signs and Symptoms

- asymptomatic, cough, dyspnea, fever, arthralgia, malaise, erythema nodosum, chest pain
- chest exam often normal
- common extrapulmonary manifestations
 - cardiac (arrhythmias, sudden death)
 - eye involvement (anterior or posterior uveitis)
 - skin involvement (skin papules, erythema nodosum, lupus pernio)
 - peripheral lymphadenopathy
 - arthralgia
 - hepatomegaly ± splenomegaly
- less common extra-pulmonary manifestations involve bone, CNS, kidney
- two acute sarcoid syndromes
 - Lofgren's syndrome: fever, erythema nodosum, bilateral hilar lymphadenopathy, arthralgias
 - Heerfordt-Waldenström syndrome: fever, parotid enlargement, anterior uveitis, facial nerve palsy

Investigations

- CBC (cytopenias from spleen or marrow involvement)
- serum electrolytes, creatinine, liver enzymes, calcium (hypercalcemia/hypercalciuria due to vitamin D activation by granulomas)
- hypergammaglobulinemia, occasionally RF positive
- elevated serum ACE (non-specific and non-sensitive)
- CXR: predominantly nodular opacities especially in upper lung zones ± hilar adenopathy
- PFTs: normal, obstructive pattern, restrictive pattern with normal flow rates and decreased DL_{CO}, or mixed obstructive/restrictive pattern
- ECG: to rule out conduction abnormalities
- slit-lamp eye exam: to rule out uveitis

Diagnosis

- biopsy
 - transbronchial lung biopsy, transbronchial lymph node aspiration, endobronchial ultrasound guided surgical (EBUS) biopsy, or mediastinoscopic lymph node biopsy for granulomas
 - in ~75% of cases, transbronchial biopsy shows granulomas in the parenchyma even if the CXR is normal

Staging

- radiographic, based on CXR
 - Stage 0: normal radiograph
 - Stage I: bilateral hilar lymphadenopathy ± paratracheal lymphadenopathy
 - Stage II: bilateral hilar lymphadenopathy with pulmonary infiltration
 - Stage III: pulmonary infiltration alone (reticulonodular pattern or nodular pattern)
 - Stage IV: pulmonary fibrosis (honeycombing)

Treatment

- 85% of stage I resolve spontaneously
- 50% of stage II resolve spontaneously
- steroids for symptoms, declining lung function, hypercalcemia, or involvement of eye, CNS, kidney, or heart (not for abnormal CXR alone)
- methotrexate or other immunosuppressives occasionally used

Prognosis

- approximately 10% mortality secondary to progressive fibrosis of lung parenchyma

Known Etiologic Agents

HYPERSENSITIVITY PNEUMONITIS

- also known as extrinsic allergic alveolitis
- non-IgE mediated inflammation of lung parenchyma (acute, subacute, and chronic forms) - Type 4 hypersensitivity reaction (see [Rheumatology, RH2](#))
- caused by sensitization to inhaled agents, usually organic dust
- pathology: airway-centred, poorly formed granulomas and lymphocytic inflammation
- exposure usually related to occupation or hobby
 - Farmer's Lung (*Thermophilic actinomycetes*)
 - Bird Breeder's/Bird Fancier's Lung (immune response to bird IgA)
 - Humidifier Lung (*Aureobasidium pullulans*)
 - Sauna Taker's Lung (*Aureobasidium* spp.)

Signs and Symptoms

- acute presentation: (4-6 h after exposure)
 - dyspnea, cough, fever, chills, malaise (lasting 18-24 h)
 - CXR: diffuse infiltrates
 - type III (immune complex) reaction

Most common presentation of sarcoidosis: asymptomatic CXR finding

Hilar adenopathy refers to enlargement of mediastinal lymph nodes which is most often seen by standard CXR as spherical/ellipsoidal and/or calcified nodes. If unilateral - think neoplasia, TB, or sarcoid. If bilateral - think sarcoid or lymphoma

Corticosteroids for Pulmonary Sarcoidosis
Cochrane DB Syst Rev 2005;CD001114
Study: Meta-analysis of 13 RCTs involving 1,066 participants examining the use of steroids (oral or inhaled) in sarcoidosis.
Results: Oral steroids demonstrated an improvement in CXR (RR 1.46, 95% CI 1.01-2.09). For inhaled corticosteroids, two studies showed no improvement in lung function and one study showed an improvement in diffusing capacity. No data on side-effects.
Conclusions: Oral steroids improve CXR findings and global scores of CXR, symptoms, and spirometry over 3-24 mo, but do not improve lung function or modify disease course. Oral steroids may be of benefit for patients with Stage 2 and 3 disease.

Calcified diaphragmatic plaques are highly suggestive of asbestosis, especially if bilateral

CXR Fibrotic Patterns

- Asbestosis: lower > upper lobes
- Silicosis: upper > lower lobes
- Coal: upper > lower lobes

- subacute presentation: more insidious onset than acute presentation
- chronic presentation
 - insidious onset
 - dyspnea, cough, malaise, anorexia, weight loss
 - PFTs: progressively restrictive
 - CXR: predominantly upper lobe reticulonodular pattern
- in both acute and chronic reactions, serum precipitins may be detectable (neither sensitive nor specific)

Treatment

- early diagnosis: avoidance of further exposure is critical as chronic changes are irreversible
- systemic corticosteroids can relieve symptoms and speed resolution

Remember to involve occupational health and place of work for data collection and treatment plan.
Also counsel re: worker's insurance as per jurisdiction (e.g. Workers Safety Insurance Board [WSIB] in Ontario)

PNEUMOCONIOSES

- reaction to inhaled inorganic dusts 0.5-5 μm in size
- no effective treatment, therefore key is exposure prevention through the use of protective equipment
- smoking cessation, annual influenza and pneumococcal vaccination, rehabilitation, lung transplant for endstage disease

Table 18. Pneumoconioses

Diagnosis	Etiology	Signs/Symptoms	Investigations	Complications
Asbestosis	Exposure risks: insulation, shipyard, construction, brake linings, pipe fitters, plumbers Slowly progressive diffuse interstitial fibrosis induced by inhaled asbestos fibres Usually requires >10-20 yr of exposure Latency period: 20-30 yr	Insidious onset Dyspnea Cough: paroxysmal, non-productive Clubbing (much more likely in asbestosis than silicosis or CWP)	CXR Lower > upper lobe Reticulonodular pattern, may develop IPF-like honeycombing Asbestos exposure can also cause pleural and diaphragmatic plaques (\pm calcification), pleural effusion, round atelectasis Microscopic examination reveals ferruginous bodies: yellow-brown rod-shaped structures which represent asbestos fibres coated in macrophages	Asbestos exposure increases risk of bronchogenic CA and malignant mesothelioma Risk of lung cancer dramatically increased for smokers
Silicosis	At risk population: sandblasters, rock miners, stone cutters, quarry and highway workers Generally requires >20 yr exposure; may develop with much shorter but heavier exposure	Dyspnea, cough, and wheezing	CXR Upper > lower lobe Early: nodular disease (simple pneumoconiosis), lung function usually normal Late: nodules coalesce into masses (progressive massive fibrosis) Possible hilar lymph node enlargement (frequently calcified), especially "egg shell" calcification	Mycobacterial infection (e.g. TB)
Coal Worker's Pneumoconiosis (CWP)	At risk population: coal workers, graphite workers Coal and silica, coal is less fibrogenic than silica	Simple CWP No signs or symptoms, usually normal lung function Complicated CWP (also known as progressive massive fibrosis) Dyspnea Course: few patients progress to complicated CWP	Simple CWP CXR: multiple nodular opacities, mostly upper lobe Pathologic hallmark is coal macule Complicated CWP CXR: opacities larger and coalesce	Caplan's syndrome: rheumatoid arthritis and CWP present as larger nodules

INTERSTITIAL LUNG DISEASE ASSOCIATED WITH DRUGS OR TREATMENTS

Drug-Induced

- antineoplastic agents: bleomycin, mitomycin, busulfan, cyclophosphamide, methotrexate, chlorambucil, BCNU (carmustine)
- antibiotics: nitrofurantoin, penicillin, sulfonamide
- cardiovascular drugs: amiodarone, tocainide
- anti-inflammatory agents: methotrexate, penicillamine
- gold salts
- illicit drugs (heroin, methadone)
- rituximab, anti-TNF- α agents (infliximab, etanercept, adalimumab)

Radiation-Induced

- early pneumonitis: approximately 6 wk post-exposure
- late fibrosis: 6-12 mo post-exposure
- infiltrates conform to the shape of the radiation field

Pulmonary Vascular Disease

Pulmonary Hypertension

Definition

- mean pulmonary arterial pressure >25 mmHg at rest and >30 mmHg with exercise, or a systolic pulmonary artery pressure of >40 mmHg at rest
- in the past, pulmonary HTN was classified as primary or secondary pulmonary HTN, but this classification was modified to a more clinically useful, treatment based classification

Table 19. World Health Organization Classification of Pulmonary Hypertension

Classification	Some Causes	Treatment Options	Consider in All Patients with PH
I. Pulmonary Arterial HTN	Idiopathic Collagen vascular disease (scleroderma, SLE, RA) Congenital systemic-to-pulmonary shunts (Eisenmenger syndrome) Persistent pulmonary hypertension of the newborn (PPHN) Portopulmonary HTN HIV infection Drugs and toxins (e.g. anorexigens) Pulmonary veno-occlusive disease Schistosomiasis Pulmonary capillary hemangiomatosis	CCBs in occasional patients with vasoreactivity (now used infrequently) advanced therapy often needed The latter includes: prostanoids, endothelin receptor antagonists, PDE5 inhibitors Lung transplantation	
II. Pulmonary HTN due to Left Heart Disease	Left-sided atrial or ventricular heart disease (e.g. LV dysfunction) Left-sided valvular heart disease (e.g. aortic stenosis, mitral stenosis) Congenital/acquired left heart inflow/outflow tract obstruction and congenital cardiomyopathies	Treat underlying heart disease	Oxygen therapy Exercise Consider anticoagulation
III. Pulmonary HTN due to Lung Disease and/or Hypoxia	Parenchymal lung disease (COPD, interstitial fibrosis, cystic fibrosis) Chronic alveolar hypoxia (chronic high altitude, alveolar hypoventilation disorders, sleep-disordered breathing)	Treat underlying cause of hypoxia and correct with supplemental oxygen (proven mortality benefit)	
IV. Chronic Thromboembolic Pulmonary HTN (CTEPH)	Thromboembolic obstruction of proximal pulmonary arteries Obstruction of distal pulmonary arteries – PE (thrombus, foreign material, tumour, in situ thrombosis)	Anticoagulation, thromboendarterectomy, riociguat	
V. Pulmonary HTN with Unclear Multifactorial Mechanisms	Hematologic disorders (e.g. sickle cell) Systemic disorders (e.g. sarcoidosis) Metabolic disorders Extrinsic compression of central pulmonary veins (tumour, adenopathy, fibrosing mediastinitis) Chronic hemolytic anemia Segmental pulmonary hypertension	Treat underlying cause	

Adapted from: Simonneau G, et al. J Am Coll Cardio 2013;62(25 Suppl):D34-D41

IDIOPATHIC PULMONARY ARTERIAL HYPERTENSION (PRIMARY PULMONARY HYPERTENSION)

Definition

- pulmonary HTN in the absence of a demonstrable cause
- histology includes medial hypertrophy, intimal fibrosis and plexiform arteriopathy
- exclude:
 - left-sided cardiac valvular disease
 - myocardial disease
 - congenital heart disease
 - any clinically significant parenchymal lung disease
 - systemic connective-tissue disease
 - chronic thromboembolic disease

Epidemiology

- usually presents in young females (20-40 yr); mean age of diagnosis is 36 yr
- most cases are sporadic; familial predisposition in 10% of cases, some linked to mutations in BMPR2
- may be associated with the use of anorexic drugs (e.g. Aminorex®, Fenfluramine®), amphetamines, and cocaine

Guidelines for Vasodilator Response in Pulmonary Arterial HTN

- Patients with IPAH that respond to vasodilators acutely, have an improved survival with long-term use of CCBs
- Vasoreactivity testing: short-acting agent such as IV epoprostenol, IV adenosine, or inhaled NO
- Positive vasodilator response: mean PAP fall of at least 10 mmHg to ≤40 mmHg with an increased or unchanged cardiac output (European Society of Cardiology)
- Positive vasodilator response: should be considered as candidate for trial of oral CCB therapy

Medical Therapy for Pulmonary Arterial Hypertension. ACCP Evidence-Based Clinical Practice Guidelines. Chest 2004;(Suppl)06:126

Signs and Symptoms

Table 20. Signs and Symptoms of Pulmonary Hypertension

Symptoms	Signs
Dyspnea	Loud, palpable P2
Fatigue	RV heave
Retrosternal chest pain	Right-sided S4 (due to RVH)
Syncope	Systolic murmur (tricuspid regurgitation [TR])
Symptoms of underlying disease	If RV failure: right sided S3, increased JVP, positive HJR, peripheral edema, TR
	Reynaud's phenomenon

Investigations

- CXR: enlarged central pulmonary arteries, cardiac changes due to RV enlargement (filling of retrosternal air space)
- ECG
 - RVH/right-sided strain (see [Cardiology and Cardiac Surgery, C7](#))
- 2-D echo doppler assessment of right ventricular systolic pressure
- cardiac catheterization: direct measurement of pulmonary artery pressures (necessary to confirm diagnosis)
- PFTs to assess for underlying lung disease: DL_{CO} usually reduced; volumes and flows normal
- CT angiogram to assess lung parenchyma and possible PE
- V/Q scan \pm pulmonary angiogram to rule out thromboembolic disease
- serology: ANA positive in 30% of patients with primary pulmonary HTN; other serologic markers can be used in the appropriate clinical setting

Treatment

- see [Table 19](#)

Prognosis

- 2-3 yr mean survival from time of diagnosis
- survival decreases to approximately 1 yr if severe pulmonary HTN or right-heart failure

Pulmonary arterial pressures are measured by pulmonary artery catheters (i.e. Swan-Ganz catheter) which are inserted into a large vein (often internal jugular). A balloon at the end of the catheter tip is inflated causing the catheter to advance through the right side of the heart and into the pulmonary artery. This allows for the measurement of RA, RV, PA, and pulmonary capillary wedge pressures as well as sampling of mixed venous blood. A thermistor near the end of the catheter also allows for assessment of cardiac output by thermodilution

Virchow's Triad

- Venous stasis
- Endothelial cell damage
- Hypercoagulable states

Multidetector Computed Tomography for Acute Pulmonary Embolism (PIOPED II Trial)

NEJM 2006;354:2317-2327

Study: Multicentre, prospective study investigating accuracy of computed tomography angiography (CTA) alone and combined with venous phase imaging (CTA-CTV) for the diagnosis of PE.

Patients: 824 patients of several thousand eligible for study received reference diagnosis to confirm absence or presence of PE (V/Q scan, venous compression I/S of lower extremities, and pulmonary digital-subtraction angiography [DSA] if necessary). To confirm absence, patients in whom PE was excluded were telephoned 3-6 mo after enrollment. Any deaths were reviewed by an outcome committee. All patients enrolled also underwent clinical assessment of PE (including a Wells' score) prior to imaging.

Outcomes: Diagnosis of pulmonary embolism.

Results: 773 of 824 patients had adequate CTAs for interpretation. PE was diagnosed in 192 of the 824 patients. Sensitivity was 83% (150 of 181 patients, 95% CI 0.76-0.92) and specificity was 96% (567 of 592 patients, 95% CI 0.93-0.97). However, the predictive value of CTA-CTV varied when clinical pre-test probability was taken into account. PPV of CTA for high, intermediate and low clinical probability were 96% (95% CI 0.78-0.99), 92% (95% CI 0.84-0.96), and 58% (95% CI 0.40-0.73), respectively. NPV of CTA for high, intermediate and low clinical probability were 60% (95% CI 0.32-0.83), 89% (95% CI 0.82-0.93), and 96% (95% CI 0.92-0.98) respectively.

Conclusion: CTA is effective for diagnosing or excluding PE in accordance with assessment of clinical pretest probability. When clinical probability is inconsistent with imaging results, further investigations are required to rule out PE.

Pulmonary Embolism

Definition

- lodging of a blood clot in the pulmonary arterial tree with subsequent increase in pulmonary vascular resistance, impaired V/Q matching, and possibly reduced pulmonary blood flow

Etiology and Pathophysiology

- one of the most common causes of preventable death in the hospital
- proximal leg thrombi (popliteal, femoral, or iliac veins) are the source of most clinically recognized pulmonary emboli
- thrombi often start in calf, but must propagate into proximal veins to create a sufficiently large thrombus for a clinically significant PE
- fewer than 30% of patients have clinical evidence of DVT (e.g. leg swelling, pain, or tenderness)
- always suspect PE if patient develops fever, sudden dyspnea, chest pain, or collapse 1-2 wk after surgery

Risk Factors

- stasis
 - immobilization: paralysis, stroke, bed rest, prolonged sitting during travel, immobilization of an extremity after fracture
 - obesity, CHF
 - chronic venous insufficiency
- endothelial cell damage
 - post-operative injury, trauma
- hypercoagulable states
 - underlying malignancy (particularly adenocarcinoma)
 - cancer treatment (chemotherapy, hormonal)
 - exogenous estrogen administration (OCP, HRT)
 - pregnancy, post-partum
 - prior history of DVT/PE, family history
 - nephrotic syndrome
 - coagulopathies: Factor V Leiden, Prothrombin 20210A variant, inherited deficiencies of antithrombin/protein C/protein S, antiphospholipid antibody, hyperhomocysteinemia, increased Factor VIII levels, and myeloproliferative disease
- increasing age

Investigations (if highly suspicious, go straight to CT angiogram)

- see [Emergency Medicine, ER33](#)

Table 21. Common Investigations for Pulmonary Embolism

Investigation	Purpose/Utility
Pulmonary Angiogram (Gold Standard)	Filling defect indicative of embolus; negative angiogram excludes clinically relevant PE More invasive, and harder to perform than CT, therefore done infrequently
D-Dimer	Highly sensitive D-dimer result can exclude DVT/PE if pretest probability is already low Little value if pretest probability is high If D-dimer positive, will need further evaluation with compression U/S (for DVT) and/or CT (for PE)
CT Angiogram	Both sensitive and specific for PE Diagnosis and management uncertain for small filling defects CT may identify an alternative diagnosis if PE is not present CT scanning of the proximal leg and pelvic veins can be done at the same time and may be helpful
Venous Duplex U/S or Doppler	With leg symptoms Positive test rules in proximal DVT Negative test rules out proximal DVT Without leg symptoms Positive test rules in proximal DVT Negative test does not rule out a DVT: patient may have non-occlusive or calf DVT
ECG	Findings not sensitive or specific Sinus tachycardia most common; may see non-specific ST segment and T wave changes RV strain, RAD, RBBB, S1-Q3-T3 with massive embolization
CXR	Frequently normal; no specific features Atelectasis (subsegmental), elevation of a hemidiaphragm Pleural effusion: usually small Hampton's hump: cone-shaped area of peripheral opacification representing infarction Westermark's sign: dilated proximal pulmonary artery with distal oligemia/decreased vascular markings (difficult to assess without prior films) Dilatation of proximal PA: rare
V/Q Scan	Very sensitive but low specificity Order scan if: CXR normal, no COPD Contraindication to CT (contrast allergy, renal dysfunction, pregnancy) Avoid V/Q scan if: CXR abnormal or COPD Inpatient Suspect massive PE Results: Normal: excludes the diagnosis of PE High probability: most likely means PE present, unless pre-test probability is low 60% of V/Q scans are nondiagnostic
Echocardiogram	Useful to assess massive or chronic PE Not routinely done
ABG	No diagnostic use in PE (insensitive and nonspecific) May show respiratory alkalosis (due to hyperventilation)

Treatment

- admit for observation (stable patients with DVT only may be sent home on LMWH)
- oxygen: supplemental O₂ if hypoxemic or short of breath
- pain relief: analgesics if chest pain – narcotics or acetaminophen
 - acute anticoagulation: therapeutic-dose SC LMWH or rivaroxaban or IV heparin (only if concern for bleeding risk) – start ASAP
 - anticoagulation stops clot propagation, prevents new clots and allows endogenous fibrinolytic system to dissolve existing thromboemboli over months get baseline CBC, INR, aPTT ± renal function ± liver function
 - for SC LMWH: dalteparin 200 U/kg once daily, enoxaparin 1 mg/kg bid or 1.5mg/kg once daily, or tinzaparin 175 U/kg once daily – no lab monitoring – avoid or reduce dose in renal dysfunction
 - for IV heparin: bolus of 75 U/kg (usually 5,000 U) followed by infusion starting at 20 U/kg/h – aim for aPTT 2-3x control
 - rivaroxaban is accepted alternative for acute PE

D-dimer is elevated in patients with recent surgery, cancer, inflammation, infection, and severe renal dysfunction. It has good sensitivity and negative predictive value, but poor specificity and positive predictive value

Classic ECG finding of PE is S1-Q3-T3 (inverted T3), but most commonly see only sinus tachycardia

Clinical Prediction Rule for Pulmonary Embolism

J Thromb Hemost 2000;83:416-420

Wells' Criteria

Risk Factors	Points
Clinical signs of DVT	3.0
No more likely alternative diagnosis (using H&P, CXR, ECG)	3.0
Immobilization or surgery in previous 4 wk	1.5
Previous PE/DVT	1.5
HR > 100 beats/min	1.5
Hemoptysis	1.0
Malignancy	1.0

Clinical Probability

Low (0-2)	3%
Intermediate (3-6)	28%
High (>6)	78%

Modified Wells': >4 PE likely; ≤4 PE unlikely
JAMA 2006

PE Rule Out Criteria (PERC)

Prospective Multicentre Evaluation of the Pulmonary Embolism Rule Out Criteria

J Thromb Hemost 2008;6:772

- Age less than 50 yr
- Heart rate less than 100 bpm
- Oxyhemoglobin saturation ≥95 percent
- No hemoptysis
- No estrogen use
- No prior DVT or PE
- No unilateral leg swelling
- No surgery or trauma requiring hospitalization within the past 4 wk

Acute PE can probably be excluded without further diagnostic testing if the patient meets all PERC criteria AND there is a low clinical suspicion for PE, according to either the Wells' criteria or a low gestalt probability determined by the clinician prior to diagnostic testing for PE.

Evaluation of a Suspected Pulmonary Embolism

Low clinical probability of embolism

D-dimer (+ve) → CT scan (+ve) → ruled in
(-ve) → ruled out (-ve) → ruled out

Intermediate or high probability

CT scan (-ve) → ruled out
(+ve) → ruled in

Notes

- Use D-dimers only if low clinical probability, otherwise, go straight to CT
- If using V/Q scans (CT contrast allergy or renal failure):
- Negative V/Q scan rules out the diagnosis
- High probability V/Q scan only rules in the diagnosis if have high clinical suspicion
- Inconclusive V/Q scan requires leg U/S to look for DVT or CT

- long-term anticoagulation
 - warfarin: start the same day as LMWH/heparin – overlap warfarin with LMWH/heparin for at least 5 d and until INR in target range of 2-3 for at least 2 d
 - LMWH instead of warfarin for pregnancy, active cancer, or high bleeding risk patients
 - direct thrombin inhibitors: can treat from outset with rivaroxaban; dabigatran has been shown to have lower bleeding risk than warfarin; no monitoring required, however agents not reversible, so avoid if bleeding concerns
- IV thrombolytic therapy
 - if patient has massive PE (hypotension or clinical right heart failure) and no contraindications
 - hastens resolution of PE but may not improve survival or long-term outcome and doubles risk of major bleeding
- interventional thrombolytic therapy
 - massive PE may be treated with catheter-directed thrombolysis by an interventional radiologist
 - catheter-directed thrombolysis is not recommended over systemic thrombolysis
- IVC filter: only if recent proximal DVT + absolute contraindication to anticoagulation
- duration of long-term anticoagulation: individualized, however generally
 - if reversible cause for PE (surgery, injury, pregnancy, etc.): 3-6 mo
 - if PE unprovoked: 6 mo to indefinite
 - if ongoing major risk factor (active cancer, antiphospholipid antibody, etc.): indefinite

Thromboprophylaxis

- mandatory for most hospital patients: reduces DVT, PE, all-cause mortality, cost-effective
- start ASAP
- continue at least until discharge or recommend extending for 35 d post-operatively, if major orthopedic surgery

Table 22. VTE Risk Categories and Prophylaxis (see Hematology, H35)

Risk Group	Prophylaxis Options
Low Thrombosis Risk	
Medical patients: fully mobile	No specific prophylaxis
Surgery: <30 min, fully mobile	Frequent ambulation
Moderate Thrombosis Risk	
Most general, gynecologic, urologic surgery	LMWH
Sick medical patients	Low dose unfractionated heparin Fondaparinux
High Thrombosis Risk	
Arthroplasty, hip fracture surgery	LMWH
Major trauma, spinal cord injury	Fondaparinux Warfarin (INR 2-3) Dabigatran Apixaban Rivaroxaban Low dose unfractionated heparin
High Bleeding Risk	
Neurosurgery, intracranial bleed	TED stockings, pneumatic compression devices
Active bleeding	LMWH or low dose heparin when bleeding risk decreases

Workup for Idiopathic VTE

Thrombophilia Workup: recurrent or idiopathic DVT/PE, age <50, FHx, unusual location, massive

Malignancy Workup: 12% of patients with idiopathic VTE will have a malignancy

The Use of Unfractionated Heparin Should Be Limited to:

- Patients with severe renal dysfunction (CrCl <30 ml/min) in whom LMWH and novel oral anticoagulation should be avoided
- Patients at elevated risk of bleeding that may need rapid reversal of anticoagulation
- Patients who receive thrombolytic therapy

Extended Use of Dabigatran, Warfarin or Placebo in Venous Thromboembolism

NEJM 2013;368:709-718

Study: Two double blind, RCTs; one comparing against placebo, the other against active treatment.

Population: 4,199 patients (2,856 in active-control study, 1,343 in placebo-control study) with VTE who had completed at least 3 mo of therapy.

Intervention: In the active-control study, patients randomized to either 150 mg dabigatran or warfarin (INR 2.0-3.0). Patients in the placebo-control study received either 150 mg dabigatran or placebo.

Outcome: Recurrence of VTE, risk of major or clinically relevant bleed.

Results: In the active-control study, there was a hazard ratio (HR) of 1.44 (95% CI 0.78-2.64 for non-inferiority) of recurrent VTE with dabigatran vs. warfarin. HR of major or clinically relevant bleed was 0.54 (95% CI 0.41-0.71). In the placebo-control study, the HR of VTE with dabigatran vs. placebo was 0.08 (95% CI 0.02-0.25). HR of major or clinically relevant bleed was 2.92 (95% CI 1.52-5.60).

Conclusions: Dabigatran appears to be non-inferior to warfarin in the prevention of VTE recurrence. Dabigatran is associated with a lower risk of major or clinically relevant bleed than warfarin, but greater than placebo.

Pulmonary Vasculitis

Table 23. Pulmonary Vasculitis

Disease	Definition	Pulmonary Features	Extra-pulmonary Features	Investigations	Treatment
Granulomatosis with Polyangiitis (GPA, previously Wegener's Granulomatosis) (see Nephrology, NP22)	Systemic vasculitis of medium and small arteries	Necrotizing granulomatous lesions of the upper and lower respiratory tract	Focal necrotizing lesions of arteries and veins; crescentic glomerulonephritis	CXR: nodules, cavities, and alveolar opacities c-ANCA Tissue confirmation	Corticosteroids and cyclophosphamide or rituximab
Eosinophilic Granulomatosis with Polyangiitis (EGPA, Churg-Strauss)	Multisystem disorder characterized by allergic rhinitis, asthma, and prominent peripheral eosinophilia	Asthma Infiltrates	Life-threatening systemic vasculitis involving the lungs, pericardium and heart, kidneys, skin, and PNS (mononeuritis multiplex)	Peripheral eosinophilia is the most common finding p-ANCA may be positive Biopsy involved tissue	Corticosteroids
Anti-GBM Disease (Goodpasture's) (see Nephrology, NP24)	A disorder characterized by diffuse alveolar hemorrhage and glomerulonephritis caused by anti-GBM antibodies, which cross-react with basement membranes of the kidney and lung	Hemoptysis May follow an influenza infection	Anemia	CXR: may see alveolar infiltrates if hemorrhage is profuse ELISA test with anti-GBM antibodies Renal biopsy/indirect immunofluorescence shows linear staining	Acutely: corticosteroids, plasmapheresis, immunosuppressive therapy Severe cases: bilateral nephrectomy
Systemic Lupus Erythematosus, Rheumatoid Arthritis, Scleroderma	See Rheumatology, RH17				

Pulmonary Edema

- see [Cardiology and Cardiac Surgery, C36](#)

Scleroderma is the most common collagen vascular disease affecting the lung

Diseases of the Mediastinum and Pleura

Mediastinal Masses

Definition

- mediastinum: bound by the thoracic inlet, diaphragm, sternum, vertebral bodies, and the pleura
- can be broken down into 3 compartments: anterior, middle, and posterior

Etiology and Pathophysiology

- diagnosis is aided by location and patient's age
- anterior compartment: more likely to be malignant
 - "Four Ts" (see sidebar), lymphoma, lipoma, pericardial cyst
- middle compartment
 - pericardial cyst, bronchogenic cyst/tumour, lymphoma, lymph node enlargement, aortic aneurysm
- posterior compartment
 - neurogenic tumours, meningocele, enteric cysts, lymphoma, diaphragmatic hernias, esophageal tumour, aortic aneurysm

Signs and Symptoms

- 50% asymptomatic (mainly benign); when symptomatic, 50% are malignant
- chest pain, cough, dyspnea, recurrent respiratory infections
- hoarseness, dysphagia, Horner's syndrome, facial/upper extremity edema (SVC compression)
- paraneoplastic syndromes (e.g. myasthenia gravis [thymomas])

Investigations

- CXR (compare to previous)
- CT with contrast (anatomic location, density, relation to mediastinal vascular structures)
- MRI: specifically indicated in the evaluation of neurogenic tumours
- U/S (best for assessment of structures in close proximity to the heart and pericardium)
- radionuclide scanning: ^{131}I (for thyroid), gallium (for lymphoma)
- biochemical studies: thyroid function, serum calcium, phosphate, PTH, AFP, β -hCG
- biopsy (mediastinoscopy, percutaneous needle aspiration)

Management

- excision if symptomatic enlarging benign masses or concerns of malignancy
- resect bronchogenic cysts and localized neurogenic tumours via minimally invasive video assisted procedures
- exploration via sternotomy or thoracotomy
- diagnostic biopsy rather than major operation if mass is likely to be a lymphoma, germ cell tumour, or unresectable invasive malignancy
- \pm post-operative radiotherapy/chemotherapy if malignant

Differential of an Anterior Compartment Mass

4 Ts

- Thymoma
- Thyroid enlargement (goitre)
- Teratoma
- Tumours (lymphoma, parathyroid, esophageal, angiomatous)

Mediastinal Components

Anterior: sternum to pericardium and great vessels. Includes: thymus, extrapericardial aorta and branches, great veins, lymphatic tissues

Middle: pericardium (anteriorly) posterior pericardial reflection, diaphragm, thoracic inlet. Includes: heart, intrapericardial great vessels, pericardium, trachea

Posterior: posterior pericardial reflection, posterior border of vertebral bodies, first rib to the diaphragm. Includes: esophagus, vagus nerve, thoracic duct, sympathetic chain, azygous venous system

Horner's Syndrome

Ptosis, Miosis, Anhidrosis

Mediastinitis

- most common causes: post-operative complications of cardiovascular or thoracic surgical procedures

Acute

- etiology
 - complication of endoscopy (e.g. esophageal perforation providing entry point for infection)
 - esophageal or cardiac surgery
 - tumour necrosis
- signs and symptoms
 - fever, substernal pain
 - pneumomediastinum, mediastinal compression
 - Hamman's sign (auscultatory "crunch" during cardiac systole)
- treatment
 - antibiotics (IV vancomycin + 3rd gen cephalosporin), drainage, ± surgical closure of perforation

Chronic

- usually granulomatous process or fibrosis related to previous infection (e.g. histoplasmosis, TB, sarcoidosis, syphilis)

Pleural Effusions

Definition

- excess amount of fluid in the pleural space (normally up to 25 mL)

Etiology

- disruption of normal equilibrium between pleural fluid formation/entry and/or pleural fluid absorption/exit
- pleural effusions are classified as transudative or exudative
 - distinguish clinically using Light's Criteria, which has a sensitivity of 98% and specificity of 83% for identifying exudative pleural effusions

Table 24. Laboratory Values in Exudative Pleural Effusion

	Light's Criteria	Modified Light's Criteria
Protein – Pleural/Serum	>0.5	>0.5
LDH – Pleural/Serum	>0.6	>0.6
Pleural LDH	>2/3 upper limit of N serum LDH	>0.45 upper limit of N serum LDH
Exudate = any one criterion		

Ann Intern Med 1979;77:507-513 *Chest* 1997;111:970-980

All criteria for transudate must be fulfilled to be considered a transudative effusion. If any one of the criteria for exudates is met – it is an exudate

Transudative Pleural Effusions

- pathophysiology: alteration of systemic factors that affect the formation and absorption of pleural fluid (e.g. increased capillary hydrostatic pressure, decreased plasma oncotic pressure)
- etiology
 - CHF: usually right-sided or bilateral
 - cirrhosis leading to hepatic hydrothorax
 - nephrotic syndrome, protein losing enteropathy, cirrhosis
 - pulmonary embolism (may cause transudative but more often causes exudative effusion)
 - peritoneal dialysis, hypothyroidism, CF, urinothorax

Transudative effusions are usually bilateral, not unilateral

Exudative effusions can be bilateral or unilateral

Exudative Pleural Effusions

- pathophysiology: increased permeability of pleural capillaries or lymphatic dysfunction
- etiology (see Table 25)

Table 25. Exudative Pleural Effusion Etiologies

Etiology	Examples
Infectious	Parapneumonic effusion (associated with bacterial pneumonia, lung abscess) Empyema (bacterial, fungal, TB) TB pleuritis Viral infection Fungal Parasitic
Malignancy	Lung carcinoma (35%) Lymphoma (10%) Metastases: breast (25%), ovary, kidney Mesothelioma Myeloma
Inflammatory	Collagen vascular diseases: RA, SLE Pancreatitis Benign asbestos related effusion Pulmonary embolism ARMS Post-CABG or cardiac injury Drug reaction
Intra-Abdominal	Subphrenic abscess Pancreatic disease (elevated pleural fluid amylase) Meigs' syndrome (ascites and hydrothorax associated with an ovarian fibroma or other pelvic tumour)
Intra-Thoracic	Esophageal perforation (elevated fluid amylase)
Trauma	Hemothorax: rupture of a blood vessel, commonly by trauma or tumours Pneumothorax (spontaneous, traumatic, tension) Chylothorax Iatrogenic
Other	Drug-induced Hypothyroidism

Signs and Symptoms

- often asymptomatic
- dyspnea: varies with size of effusion and underlying lung function
- orthopnea
- pleuritic chest pain
- inspection: trachea deviates away from effusion, ipsilateral decreased expansion
- percussion: decreased tactile fremitus, dullness
- auscultation: decreased breath sounds, bronchial breathing and egophony at above fluid level, pleural friction rub

Investigations

- CXR
 - must have >200 mL of pleural fluid for visualization on PA film
 - lateral: >50 mL leads to blunting of posterior costophrenic angle
 - PA: blunting of lateral costophrenic angle
 - dense opacification of lung fields with concave meniscus
 - decubitus: fluid will layer out unless it is loculated
 - supine: fluid will appear as general haziness
- CT may be helpful in differentiating parenchymal from pleural abnormalities, may identify underlying lung pathology
- U/S: detects small effusions and can guide thoracentesis
- thoracentesis: indicated if pleural effusion is a new finding; be sure to send off blood work (LDH, glucose, protein) at the same time for comparison
 - risk of re-expansion pulmonary edema if >1.5 L of fluid is removed
 - inspect for colour, character, and odour of fluid
 - analyze fluid
- pleural biopsy: indicated if suspect TB, mesothelioma, or other malignancy (and if cytology negative)

**Appearance of Pleural Fluid**

- Bloody: trauma, malignancy
- White: empyema, chylous or chyliform effusion
- Black: aspergillosis, amoebic liver abscess
- Yellow-green: rheumatoid pleurisy
- Viscous: malignant mesothelioma
- Ammonia odour: urinothorax
- Food particles: esophageal rupture

**Role of CT in Pleural Effusion**

- To assess for fluid loculation, pleural thickening and nodules, parenchymal abnormalities and adenopathy
- Helps to distinguish benign from malignant effusion and transudative from exudative effusion
- May not distinguish empyema from parapneumonic effusion

Features of Malignant Effusion

- Multiple pleural nodules

Features of Exudative Effusion

- Loculation
- Pleural thickening
- Pleural nodules
- Extrapleural fat of increased density

Table 26. Analysis of Pleural Effusion

Measure	Purpose
Protein, LDH	Transudate vs. exudate LDH especially high (>1000 IU/L) in empyema, rheumatoid, malignancy Protein especially high in TB, myeloma
Gram Stain, Ziehl-Nielsen Stain (TB), Culture	Looking for specific organisms
Cell Count Differential	Neutrophils vs. lymphocytes (lymphocytic effusion in TB, cancer, lymphoma, serositis)
Cytology	Malignancy, infection
Glucose	Low (fluid:serum < 0.5) in rheumatoid, TB, empyema, malignancy, esophageal rupture
Rheumatoid Factor, ANA, Complement	Collagen vascular disease
Amylase	Pancreatitis, esophageal perforation, malignancy
pH	Normally about 7.6 Very low (<7.0) in empyema, TB, rheumatoid, malignancy, esophageal rupture
Blood	Mostly traumatic, malignancy, PE with infarction, TB
Triglycerides	Chylothorax from thoracic duct leakage, mostly due to trauma, lung CA, or lymphoma
Cholesterol	Distinguish between chylous and chyliform effusion (seen in inflammation, e.g. TB, RA)

**Pleural Effusions**

Simple Effusion
pH >7.2, LDH <1/2 serum,
glucose >2.2

Complicated Effusion

pH <7.2, LDH >1/2 serum,
glucose <2.2, positive Gram stain
Needs drainage

Treatment

- thoracentesis
- treat underlying cause
- consider indwelling pleural catheter or pleurodesis in refractory effusions

Complicated Effusion

- persistent bacteria in the pleural space but fluid is non-purulent
- neutrophils, pleural fluid acidosis (pH <7.00), and high LDH
- often no bacteria grown since rapidly cleared from pleural space
- fibrin layer leading to loculation of pleural fluid
- treatment: antibiotics depending on gram stain and chest tube drainage

Empyema

Definition

- pus in pleural space or an effusion with organisms seen on a Gram stain or culture (e.g. pleural fluid is grossly purulent)
- positive culture is not required for diagnosis

Etiology

- contiguous spread from lung infection (most commonly anaerobes) or infection through chest wall (e.g. trauma, surgery)

Signs and Symptoms

- fever, pleuritic chest pain

Investigations

- CT chest
- thoracentesis
- PMNs (lymphocytes in TB) ± visible organisms on Gram stain

Treatment

- antibiotic therapy for at least 4-6 wk (rarely effective alone)
- complete pleural drainage with chest tube
- if loculated, more difficult to drain – may require surgical drainage with video-assisted thorascopic surgery (VATS), or removal of fibrin coating (surgical or tPA/DNase) to allow lung re-expansion (decortication)

When possible, organism-directed therapy, guided by culture sensitivities or local patterns of drug resistance, should be utilized

Atelectasis

- see [General Surgery, GS10](#)

Pneumothorax

Definition

- presence of air in the pleural space

Pathophysiology

- entry of air into pleural space raises intrapleural pressure causing partial lung deflation

Etiology

- traumatic: penetrating or non-penetrating chest injuries
- iatrogenic (central venous catheter, thoracentesis, mechanical ventilation with barotrauma)
- spontaneous (no history of trauma)
 - primary (no underlying lung disease)
 - ♦ spontaneous rupture of apical subpleural bleb (packets of air) of lung into pleural space
 - ♦ smoker, male, family history, Marfan's syndrome
 - secondary (underlying lung disease)
 - ♦ rupture of subpleural bleb which migrates along bronchioalveolar sheath to the mediastinum then to the intrapleural space
 - ♦ necrosis of lung tissue adjacent to pleural surface
 - ♦ pneumonia, abscess, PCP, lung CA, COPD, CF, TB

Signs and Symptoms

- can be asymptomatic
- acute-onset pleuritic chest pain, dyspnea
- tachypnea, tachycardia
- tracheal deviation (contralateral deviation in tension pneumothorax)
- ipsilateral diminished chest expansion
- decreased tactile/vocal fremitus
- hyperresonance
- ipsilateral diminished breath sounds

Investigations

- CXR
 - small: separation of visceral and parietal pleura seen as fine crescentic line parallel to chest wall at apex
 - large: decreased density and decreased volume of lung on side of pneumothorax
 - see [Medical Imaging, M18](#)

Treatment

- primary spontaneous pneumothorax
 - stable, small (<3 cm), minimal symptoms: observation + O₂
 - if symptomatic or large (>3 cm): aspiration
 - unstable/tension pneumothorax: needle decompression then chest tube, and VATS if unsuccessful (25-50%)
- secondary spontaneous pneumothorax
 - stable, small (<3 cm), minimal symptoms: observation + O₂
 - if symptomatic, large, or unstable: chest tube, and VATS if unsuccessful

Need to Rule Out Life-Threatening Tension

Pneumothorax

If pneumothorax with:

- Severe respiratory distress
- Tracheal deviation to contralateral side
- Distended neck veins (↑ JVP)
- Hypotension

Do not perform CXR

Needs immediate treatment

See [Emergency Medicine, ER11](#)

Asbestos-Related Pleural Disease and Mesothelioma

Etiology and Pathophysiology

- benign manifestations of asbestos exposure:
 - "benign asbestos pleural effusion"
 - ♦ exudative effusion, typically ~10 yr after exposure, resolves
 - pleural plaques, usually calcified
 - ♦ marker of exposure; usually an asymptomatic radiologic finding
- mesothelioma
 - primary malignancy of the pleura
 - decades after asbestos exposure (even with limited exposure)
 - smoking not a risk factor, but asbestos and smoking synergistically increase risk of lung cancer

Signs and Symptoms

- persistent chest pain, dyspnea, cough, bloody pleural effusion, weight loss

Investigations

- biopsy (pleuroscopic or open)
- needle biopsy may seed needle tract with tumour

Treatment

- resection (extrapleural pneumonectomy) requires careful patient selection; rarely successful (average survival <1 yr)

Respiratory Failure

Definition

- failure of respiratory system to maintain normal blood gases
- hypoxemic ($P_aO_2 < 60$ mmHg)
- hypercapnic ($P_aCO_2 > 50$ mmHg)
- acute vs. chronic (compensatory mechanisms activated)

Signs and Symptoms

- signs of underlying disease
- hypoxemia: restlessness, confusion, cyanosis, coma, cor pulmonale
- hypercapnia: headache, dyspnea, drowsiness, asterixis, warm periphery, plethora, increased ICP (secondary to vasodilatation)

Investigations

- serial ABGs
- CXR and/or CT, bronchoscopy to characterize underlying cause if unclear

Hypoxemic Respiratory Failure

Definition

- P_aO_2 decreased, P_aCO_2 normal or decreased

Treatment

- reverse the underlying pathology
- oxygen therapy: maintain oxygenation (if shunt present, supplemental O_2 is less effective; see [Anesthesia and Perioperative Medicine, A10](#), for oxygen delivery systems)
- ventilation, BiPAP, and PEEP/CPAP (see [Anesthesia and Perioperative Medicine, A10](#)): positive pressure can recruit alveoli and redistribute lung fluid
- improve cardiac output: \pm hemodynamic support (fluids, vasopressors, inotropes), reduction of O_2 requirements

Table 27. Approach to Hypoxemia

Type of Hypoxemia	Settings	P_aCO_2	A-a DO_2	Oxygen Therapy	Ventilation, BiPAP and PEEP	Improved Cardiac Output
1. Low F_iO_2	Postop, high altitude	N or ↓	N	Improves	No change	No change
2. Hypoventilation	Drug overdose	↑	N	Improves	Improves with ventilation	No change
3a. Shunt (Intrapulmonary)	ARDS, pneumonia	N or ↓	↑	No change	Improves (except if one-sided)	Improves
3b. Shunt (Right to Left)	Pulmonary HTN	N or ↓	↑	No change	Worsens	Worsens
4. Low Mixed Venous O_2 Content	Shock	↓	↑	Improves or no change	Worsens	Improves
5. V/Q Mismatch	COPD	N or ↑	↑	Improves (small amounts)	Often improves	Improves
6. Diffusion Impairment	ILD, emphysema	N	↑	Improves	Improves with positive pressure	No change or worsens

Reprinted with permission from Dr. Ian Fraser

Hypercapnic Respiratory Failure

Definition

- P_aCO_2 increased, P_aO_2 decreased

Pathophysiology

- increased CO_2 production: fever, sepsis, seizure, acidosis, carbohydrate load
- alveolar hypoventilation: COPD, asthma, CF, chest wall disorder, dead space ventilation (rapid shallow breathing)
 - inefficient gas exchange results in inadequate CO_2 removal in spite of normal or increased minute volume
- hypoventilation
 - central: brainstem stroke, hypothyroidism, severe metabolic alkalosis, drugs (opiates, benzodiazepines)
 - neuromuscular: myasthenia gravis, Guillain-Barré, phrenic nerve injury, muscular dystrophy, polymyositis, kyphoscoliosis
 - muscle fatigue

Dead Space

- Ventilation without perfusion
- The opposite of shunt

Causes of Hypercapnia

- High Inspired CO_2
- Low Total Ventilation
- High Deadspace Ventilation
- High CO_2 Production

Treatment

- reverse the underlying pathology
- if $P_aCO_2 > 50$ mmHg and $pH < 7.35$ consider noninvasive or mechanical ventilation
- correct exacerbating factors
 - NTT/ETT suction: clearance of secretions
 - bronchodilators: reduction of airway resistance
 - antibiotics: treatment of infections
- maintain oxygenation (see above)
- diet: increased carbohydrate can increase P_aCO_2 in those with mechanical or limited alveolar ventilation; high lipids decrease P_aCO_2

In chronic hypercapnia, supplemental O_2 may decrease the hypoxic drive to breathe, but do not deny oxygen if the patient is hypoxic

In COPD patients with chronic hypercapnia ("CO₂ retainers"), provide supplemental oxygen to achieve target SpO_2 from 88-92%

ALI vs. ARDS: Definition is the same, except ALI is a $P_aO_2/FiO_2 \leq 300$, while ARDS is a $P_aO_2/FiO_2 \leq 200$

Categorization of ARDS as Mild, Moderate or Severe – The Berlin Criteria

ARDS Severity	P_aO_2/FiO_2 (mmHg)*	Mortality (95% CI)#
Mild	200-300	27 (24-30)%
Moderate	100-200	32 (29-34)%
Severe	< 100	45 (42-48)%

*on ≥ 5 cm H₂O PEEP, #P < 0.001
JAMA 2012;307:2526-2533

Risk Factors for Aspiration Pneumonia

Categories	Examples
Decreased level of consciousness	Alcoholism
Upper GI tract disorders	Dysphagia, esophageal disorders
Mechanical instrumentation	Intubation, nasogastric tube, feeding tubes
Neurologic conditions	Dementia, Parkinson disease
Others	Protracted vomiting

Acute Respiratory Distress Syndrome

Definition

- clinical syndrome characterized by severe respiratory distress, hypoxemia, and noncardiogenic pulmonary edema
- The Berlin Criteria (JAMA 2012; 307:2526-2533) for ARDS
 - acute onset
 - ♦ within 7 d of a defined event, such as sepsis, pneumonia, or patient noticing worsening of respiratory symptoms
 - usually occurs within 72 h of presumed trigger
 - ♦ bilateral opacities consistent with pulmonary edema on either CT or CXR
 - ♦ not fully explained by cardiac failure/fluid overload, but patient may have concurrent heart failure
 - ♦ objective assessment of cardiac function (e.g. echocardiogram) should be performed even if no clear risk factors

Etiology

- direct lung injury
- airway: aspiration (**gastric contents**, drowning), **pneumonia**, inhalation injury (oxygen toxicity, nitrogen dioxide, smoke)
- circulation: embolism (fat, amniotic fluid), reperfusion injury
- indirect lung injury
- circulation: **sepsis**, **shock**, **trauma**, blood transfusion, pancreatitis
- neurogenic: head trauma, intracranial hemorrhage, drug overdose (narcotics, sedatives, TCAs)

Pathophysiology

- disruption of alveolar capillary membranes → leaky capillaries → interstitial and alveolar pulmonary edema → reduced compliance, V/Q mismatch, shunt, hypoxemia, pulmonary HTN

Clinical Course

A. Exudative Phase

- first 7 d of illness after exposure to ARDS precipitant
- alveolar capillary endothelial cells and type I pneumocytes are injured, resulting in loss of normally tight alveolar barrier
- patients develop dyspnea, tachypnea, increased work of breathing
 - these result in respiratory fatigue and eventually respiratory failure (see *Hypoxemic Respiratory Failure*, R26)

B. Fibroproliferative Phase

- after day 7
- may still experience dyspnea, tachypnea, fatigue, and hypoxemia
- most patients clinically improve and are able to wean off mechanical ventilation
- some patients develop fibrotic lung changes that may require long-term support on supplemental oxygen or even mechanical ventilation
- if fibrosis present, associated with increased mortality

Treatment

- based on ARDS Network (see *Landmark Respiriology Trials*, R38)
- treat underlying disorder (e.g. antibiotics if infection present)
- mechanical ventilation using low tidal volumes (<6 mL/kg) to prevent barotrauma
 - use optimal amount of PEEP (positive end-expiratory pressure) to keep airways open and allow the use of lower F_iO_2
 - may consider using prone ventilation, ± inhaled nitric oxide, short term paralytics (<48 h) or ECMO (extracorporeal membrane oxygenation) if conventional treatment is failing
- fluids and inotropic therapy (e.g. dopamine, vasopressin) if cardiac output inadequate
- pulmonary-arterial catheter now seldom used for monitoring hemodynamics
- mortality: 30-40%, usually due to non-pulmonary complications
- sequelae of ARDS include residual pulmonary impairment, severe debilitation, polyneuropathy and psychologic difficulties, which gradually improve over time
- most survivors eventually regain near-normal lung function, often with mildly reduced diffusion capacity

Neoplasms

Lung Cancer

Classification

- lung tumours can be classified as primary or secondary, benign or malignant, endobronchial or parenchymal
- bronchogenic carcinoma (epithelial lung tumours) are the most common type of primary lung tumour (other types make up less than 1%)
 - small cell lung cancer (SCLC): 10-15%
 - non-small-cell lung cancer (NSCLC): 85-90%
 - ♦ squamous cell carcinoma: arise from the proximal respiratory epithelium
 - ♦ adenocarcinoma: incidence is increasing; most common subtype in nonsmokers
 - mucinous adenocarcinoma: grows along the alveolar wall in the periphery; may arise at sites of previous lung scarring
 - ♦ large cell undifferentiated cancer: diagnosis of exclusion
- benign epithelial lung tumours can be classified as papillomas or adenomas

Table 28. Characteristics of Bronchogenic Cancer

Cell Type	Percentage of bronchogenic Ca	Correlation with Smoking	Location	Histology	Metastasis	5 Yr Survival Rates
SCLC	10-15%	Strong	Central	Oat cell, neuroendocrine	Disseminated at presentation Origin in endobronchial cells	1% (poorest prognosis)
Adenocarcinoma	M: 35% F: 40%	Weak	Peripheral	Glandular, mucin producing	Early, distant	12% (60% for mucinous adenocarcinoma, a subtype, with a resectable solitary lesion)
Squamous Cell Carcinoma (SCC)	30%	Strong	Central	Keratin, intercellular bridges	Local invasion and distant spread, may cavitate	25%
Large Cell Carcinoma	10-15%	Strong	Peripheral	Anaplastic, undifferentiated	Early, distant	13%

Risk Factors

- cigarette smoking: the relative risk of developing lung cancer is 10-30 times higher for smokers than for nonsmokers
- risk of lung cancer increases with number of cigarettes smoked per day (linear) and duration of smoking (exponential)
- other risk factors include cigar smoking, pipe smoking, second-hand smoke, asbestos without smoking (relative risk is 5), asbestos with smoking (relative risk is 92), metals (e.g. chromium, arsenic, nickel), radon gas, ionizing radiation, genetics

Signs and Symptoms

- may be due to primary lesion, metastasis, or paraneoplastic syndrome
- primary lesion
 - cough (75%): beware of chronic cough that changes in character
 - dyspnea (60%)
 - chest pain (45%)
 - hemoptysis (35%)
 - other pain (25%)
 - clubbing (21%)
 - constitutional symptoms: anorexia, weight loss, fever, fatigue
- metastasis
 - lung, hilum, mediastinum, pleura: pleural effusion, atelectasis, wheezing, postobstructive pneumonia
 - pericardium: pericardial effusion, pericardial tamponade
 - esophageal compression: dysphagia
 - phrenic nerve: paralyzed diaphragm
 - recurrent laryngeal nerve: hoarseness

Summary of Recommendations on Screening for Lung Cancer

Canadian Task Force on Preventative Health Care (2016)

Screening with CXR (\pm sputum cytology) not recommended
 Screening with low-dose CT recommended for high-risk patients (current or former smokers quit within last 15 yr, aged 55-74, ≥ 30 pack yr smoking Hx) for 3 consecutive years
 Number needed to screen = 322

American College of Chest Physicians (2013)

Screening with CXR not recommended
 Screening with low-dose CT recommended for high-risk patients (current or former smokers quit within last 15 yr, aged 55-74, ≥ 30 pack yr smoking Hx)

American Lung Association (2013)

Screening with CXR not recommended
 Screening with low-dose CT recommended for high-risk patients (current or former smokers aged 55-74, ≥ 30 pack yr smoking Hx, no Hx of lung cancer)

Malignant lung tumours are the most common cause of cancer mortality throughout the world in both men and women

- superior vena cava syndrome
 - ♦ obstruction of SVC causing neck and facial swelling, as well as dyspnea and cough
 - ♦ other symptoms: hoarseness, tongue swelling, epistaxis, and hemoptysis
 - ♦ physical findings: dilated neck veins, increased number of collateral veins covering the anterior chest wall, cyanosis, edema of the face, arms, and chest, Pemberton's sign (facial flushing, cyanosis, and distension of neck veins upon raising both arms above head)
 - ♦ milder symptoms if obstruction is above the azygos vein
- lung apex (Pancoast tumour): Horner's syndrome, brachial plexus palsy (most commonly C8 and T1 nerve roots)
- rib and vertebrae: erosion
- distant metastasis to brain, bone, liver, adrenals
- paraneoplastic syndromes
 - a group of disorders associated with malignant disease, not related to the physical effects of the tumour itself
 - most often associated with SCLC

Table 29. Paraneoplastic Syndromes

System	Clinical Presentation	Associated Malignancy
Skeletal	Clubbing, hypertrophic pulmonary osteoarthropathy (HPOA)	Non-small cell lung cancer (NSCLC)
Dermatologic	Acanthosis nigricans Dermatomyositis	Bronchogenic cancer Bronchogenic cancer
Endocrine	Hypercalcemia (osteolysis or PTHrP) Hypophosphatemia Hypoglycemia Cushing's syndrome (ACTH) Somatostatinoma syndrome SIADH	Squamous cell cancer Squamous cell cancer Sarcoma Small cell lung cancer (SCLC) Bronchial carcinoid SCLC
Neuromyopathic	Lambert-Eaton syndrome Polymyositis Subacute cerebellar degeneration Spinocerebellar degeneration Peripheral neuropathy	SCLC
Vascular/Hematologic	Nonbacterial endocarditis Trousseau's syndrome (migratory thrombophlebitis) DIC	Bronchogenic cancer NSCLC
Renal	Nephrotic syndrome	

Investigations

- initial diagnosis
 - imaging: CXR, CT chest + upper abdomen, PET scan
 - cytology: sputum
 - biopsy: bronchoscopy, EBUS, CT-guided percutaneous needle biopsy, mediastinoscopy
- staging workup
 - TNM staging system: T – primary tumour (size); N – regional lymph nodes; M – distant metastasis
 - blood work: electrolytes, LFTs, calcium, ALP
 - imaging: CXR, CT thorax and upper abdomen, bone scan, neuroimaging, PET scan
 - invasive: bronchoscopy (EBUS), mediastinoscopy, mediastinotomy, thoracotomy
 - screen adenocarcinoma for EGFR and ALK mutations

**Horner has a MAP of the Coast**

A **Pancoast** tumour compresses the cervical sympathetic plexus causing a **Horner's syndrome**:

Miosis
Anhidrosis
Ptosis

**Reduced Lung Cancer Mortality with Low-Dose CT Screening**

NEJM 2011;365:395-409

Study: Multicentre, RCT.

Methods: 53,454 participants at high risk for lung cancer (55-74 yr, >30 yr smoking, and smoking cessation for <5 y) were assigned to undergo three annual screenings with either low dose CT or single-view PA CXR.

Results: A relative reduction in mortality from lung cancer with low-dose CT screening of 20.0% (95% CI 6.8-26.7; $p=0.004$). Rate of death from any cause was reduced in the low-dose CT group as compared to the CXR group by 6.7% (95% CI 1.2-13.6; $p=0.02$).

	Low-dose CT	CXR
Rate of positive screening test	24.2%	6.9%
False positives	96.4%	94.5%
Incidence of lung cancer	645/100 K person yr	572/100 K person yr
Deaths from lung cancer	247/100 K person yr	309/100 K person yr

Conclusions: Screening with low-dose CT reduces mortality from lung cancer.

**Endobronchial Ultrasound (EBUS)**

- Allows visualization of peri-bronchial structures and distal peripheral lung lesions
- Provides detailed assessment of the airway wall layers
- Allows for guided biopsies of lymph nodes and tumours
- Used for diagnosis and staging

Table 30. SCLC vs. NSCLC

	Stage	Definition	Treatment	Median Survival
SCLC	Limited stage	Confined to single radiation port (one hemithorax and regional lymph nodes)	Radiation ± chemotherapy ± prophylactic to brain	1-2 yr (12 wk without treatment)
	Extensive stage	Extension beyond a single radiation port	Chemotherapy	6 mo (5 wk without treatment)
	Stage	TNM	Treatment	5 Yr Survival (%)*
NSCLC	IA	T1a-1bN0M0	1st line is complete surgical resection (VATS or open thoracotomy) with possible post-operative adjuvant chemotherapy with stage IB and stage II; radiotherapy for non-surgical candidates	50-73
	IB	T2aN0M0		43-58
	IIA	T1a-T2a,N1M0 or T2bN0M0		36-46
	IIB	T2bN1M0 or T3N0M0		25-36
	IIIA	T1a-T2bN2M0 or T3N1-2M0 or T4N0-1M0	Combined modality approach (chemotherapy, radiation therapy and sometimes surgical resection)	19-24
	IIIB	T4N2M0 or T1-4N3M0		7-9
	IV	T1-4N0-3M1a-1b	Systemic therapy or molecularly targeted therapy or symptom-based palliative management (radiation); isolated metastasis may be resected	2-13

* Depends on clinical vs. pathologic stage

Refer to AJCC Cancer Staging Manual, 7th ed. 2010 for complete TNM classification

Treatment

- options include surgery, radiotherapy, chemotherapy, and palliative care for end-stage disease
- surgery not usually performed for SCLC since it is generally non-curable
- contraindications for surgery
 - spread to contralateral lymph nodes or distant sites
 - patients with potentially resectable disease must undergo mediastinal node sampling since CT thorax is not accurate in 20-40% of cases
 - poor pulmonary status (e.g. unable to tolerate resection of lung)
 - post-op estimated FEV₁ and DL_{CO} must be at least 40% of predicted to tolerate surgery
- chemotherapy (used in combination with other treatments)
 - common agents: etoposide, platinum agents (e.g. cisplatin), ifosfamide, vincristine, anthracyclines, paclitaxel, irinotecan, gefitinib (an endothelial growth factor receptor inhibitor)
 - complications
 - acute: tumour lysis syndrome, infection, bleeding, myelosuppression, hemorrhagic cystitis (cyclophosphamide), cardiotoxicity (doxorubicin), renal toxicity (cisplatin), peripheral neuropathy (vincristine)
 - chronic: neurologic damage, leukemia, additional primary neoplasms

2/3 of primary lung cancer is found in the upper lung; 2/3 of metastases occur in the lower lung (hematogenous spread secondary to increased blood flow to the base of the lung)

Prevention
Smoking cessation
Avoidance of exposures
Early detection

Terminology
• "nodule" <3 cm
• "mass" >3 cm

Hamartomas
• 10% of benign lung lesions
• Composed of tissues normally present in lung (fat, epithelium, fibrous tissue, and cartilage), but they exhibit disorganized growth
• Peak incidence is age 60, more common in men
• Usually peripheral and clinically silent
• CXR shows clustered "popcorn" pattern of calcification (pathognomonic for hamartoma)

Approach to the Solitary Pulmonary Nodule

- see [Medical Imaging, MI7](#)

Definition

- a round or oval, sharply circumscribed radiographic lesion up to 3 cm, which may or may not be calcified, and is surrounded by normal lung
- can be benign or malignant

Table 31. Differential Diagnosis for Benign vs. Malignant Solitary Nodule

Benign (70%)	Malignant (30%)	
Infectious granuloma (histoplasmosis, coccidiomycosis, TB, atypical mycobacteria) - most common	Bronchogenic carcinoma	Metastatic lesions
Other infections (bacterial abscess, PCP, aspergilloma)	Adenocarcinoma	Breast
Benign neoplasms (hamartoma, lipoma, fibroma)	Squamous cell carcinoma	Head and neck
Vascular (AV malformation, pulmonary varix)	Large cell carcinoma	Melanoma
Developmental (bronchogenic cyst)	Small cell carcinoma	Colon
Inflammatory (granulomatosis with polyangiitis, rheumatoid nodule, sarcoidosis, amyloidosis)		Kidney
Other (infarct, pseudotumour, rounded atelectasis, lymph nodes, amyloidoma)		Sarcoma
		Germ cell tumours
		Pulmonary carcinoid

Investigations

- CXR: always compare with previous CXR
- CT densitometry and contrast enhanced CT of thorax
- sputum cytology: usually poor yield
- biopsy (bronchoscopic or percutaneous) or excision (thoracoscopy or thorotomy): if clinical and radiographic features do not help distinguish between benign or malignant lesion
 - if at risk for lung cancer, biopsy may be performed regardless of radiographic features
 - if a biopsy is non-diagnostic, whether to observe, re-biopsy, or resect will depend on the level of suspicion
- watchful waiting: repeat CXR and/or CT scan at 3, 6, 12 mo
- PET scan can help distinguish benign from malignant nodules

Table 32. CT Characteristics of Benign vs. Malignant Solitary Nodule

Parameters	Benign	Malignant
Size	Nodule (<3 cm)	Mass (>3 cm)
Borders	Smooth or lobulated	Irregular or spiculated
Features	Calcified pattern: diffuse, central, laminated, "popcorn" pattern if hamartoma, usually no cavitation; if cavitating, wall is smooth and thin, no other lung pathology	Usually not calcified; if calcified, pattern is eccentric, stippled, no satellite lesions, cavitation with thick wall, may have pleural effusions, lymphadenopathy
Doubling Time	Doubles in <20 days or >400 days	Doubles between 20 and 400 days

Pulmonary neoplasms may present as a solitary pulmonary nodule identified incidentally on a radiographic study (~10% of cases) or as symptomatic disease (most cases)

Adenocarcinoma present in a non-smoker may be due to endothelial growth factor receptor mutation

Corona Radiata Sign on Chest CT

- Fine striations that extend linearly from a nodule in a spiculated fashion
- Highly associated with malignancy

Carcinoids

- Early onset (40-60 yr)
- Most are central and can produce symptoms and signs of bronchial obstruction
- Hemoptysis is present in ~50% of cases

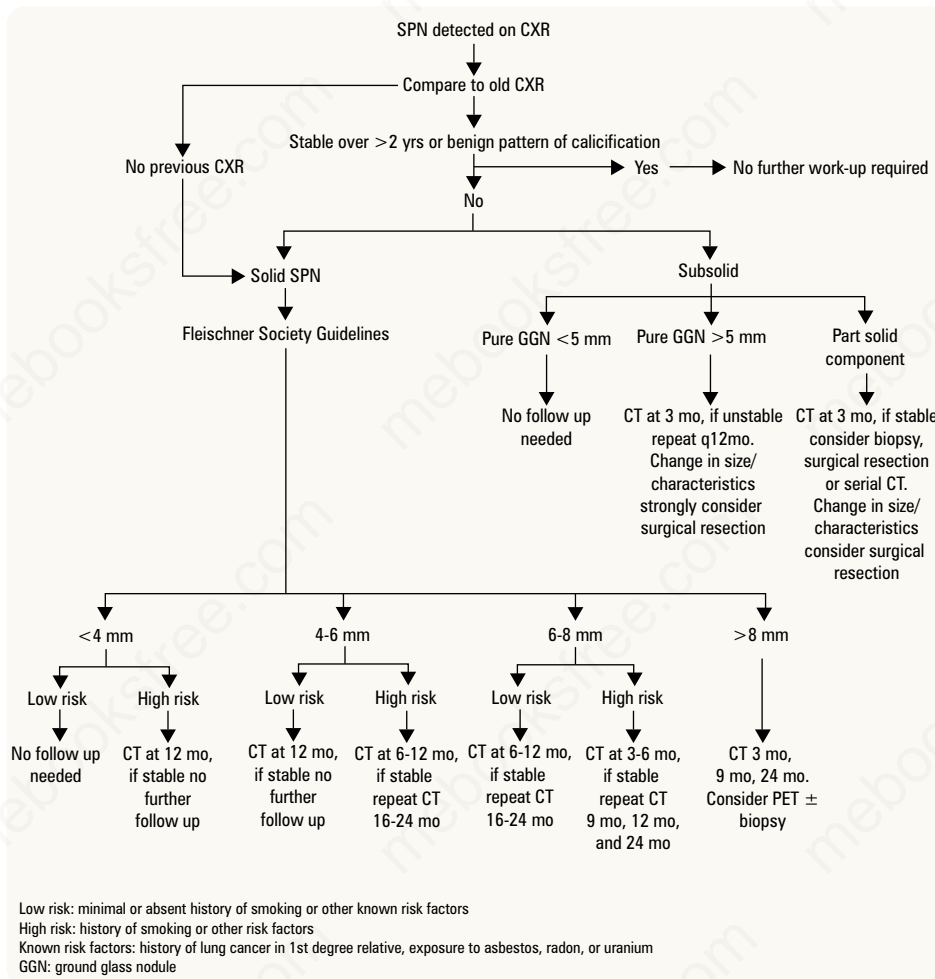

Figure 11. Evaluation of a solitary pulmonary nodule

Adapted from: Patel et al 2013 & Fleischner Society 2005.

Sleep-Related Breathing Disorders

Hypoventilation Syndromes

- primary alveolar hypoventilation: idiopathic
- obesity-hypoventilation syndrome (Pickwickian syndrome)
- respiratory neuromuscular disorders

Sleep Apnea

Definition

- episodic decreases in airflow during sleep
- quantitatively measured by the Apnea/Hypopnea Index (AHI) = # of apneic and hypopneic events per hour of sleep
- sleep apnea generally accepted to be present if AHI >15

Classification

- obstructive (OSA)
- caused by transient, episodic obstruction of the upper airway
- absent or reduced airflow despite persistent respiratory effort
- central (CSA) (see [Neurology, N47](#))
- caused by transient, episodic decreases in CNS drive to breathe
- no airflow because no respiratory effort
- Cheyne-Stokes Respiration: a form of CSA in which central apneas alternate with hyperpneas to produce a crescendo-decrescendo pattern of tidal volume; seen in severe LV dysfunction, brain injury, and other settings (see [Figure 2](#))
- mixed (MSA)
- features of both OSA and CSA
- loss of hypoxic and hypercapnic drives to breathe secondary to “resuscitative breathing”: overcompensatory hyperventilation upon awakening from OSA induced hypoxia

Risk Factors

- for OSA: obesity, upper airway abnormality, neuromuscular disease, hypothyroidism, alcohol/sedative use, nasal congestion, sleep deprivation, enlarged tonsils
- for CSA: LV failure, brainstem lesions, encephalitis, encephalopathy, myxedema, high altitude

Signs and Symptoms

- obtain history from spouse/partner
- secondary to repeated arousals and fragmentation of sleep: daytime somnolence, personality and cognitive changes, snoring
- secondary to hypoxemia and hypercapnia: morning headache, polycythemia, pulmonary/systemic HTN, cor pulmonale/CHF, nocturnal angina, arrhythmias
- the typical presentation for OSA is a middle-aged obese male who snores

Investigations

- sleep study (polysomnography)
- evaluates sleep stages, airflow, ribcage movement, ECG, SaO₂, limb movements
- indications
 - excessive daytime sleepiness
 - unexplained pulmonary HTN or polycythemia
 - daytime hypercapnia
 - titration of optimal nasal CPAP
 - assessment of objective response to other interventions

Treatment

- modifiable factors: weight loss, decreased alcohol/sedatives, nasal decongestion, treatment of underlying medical conditions
- OSA or MSA: nasal CPAP, postural therapy (e.g. no supine sleeping), dental appliance, uvulopalatopharyngoplasty, tonsillectomy
- CSA or hypoventilation syndromes: nasal BiPAP/CPAP, respiratory stimulants (e.g. acetazolamide, theophylline, progesterone), adaptive servoventilation (e.g. progesterone) in select cases
- tracheostomy rarely required and should be used as last resort for OSA

Complications

- depression, weight gain, decreased quality of life, workplace and vehicular accidents, cardiac complications (e.g. HTN), reduced work/social function

Normal Respiratory Changes during Sleep

- Tidal volume decreases
- Arterial CO₂ increases (due to decreased minute ventilation)
- Pharyngeal dilator muscles relax causing increased upper airway resistance

- Apnea:** absence of breathing for ≥10 s
- Hypopnea:** excessive decrease in rate or depth of breathing (>50% reduction in ventilation for >10 sec)
- Hyperpnea:** excessive increase in rate or depth of breathing

Continuous Positive Airways Pressure for Obstructive Sleep Apnea

Cochrane DB Syst Rev 2006;CD001106

Study: Pooled analysis of 36 RCTs (n=1,718)

comparing nocturnal CPAP with an inactive control or oral appliances in adults with OSA.

Conclusions: The use of CPAP showed significant improvements in objective and subjective measures including cognitive function, sleepiness, measures of quality of life, and a lower average systolic and diastolic blood pressure. People who responded equally well to CPAP and oral appliances expressed a strong preference for oral appliances; however, participants on oral appliances were more likely to withdraw from therapy.

CPAP has been shown to reduce cardiovascular risk and cardiovascular related deaths in patients with obstructive sleep apnea

Introduction to Intensive Care

Intensive Care Unit Basics

- goal is to provide stabilization for critically ill patients: hemodynamic, respiratory or cardiac instability, or need for close monitoring

Lines and Catheters

- arterial lines
 - monitor beat-to-beat blood pressure variations, obtain blood for routine ABGs
 - common sites are the radial and femoral arteries
- central venous catheter (central line)
 - administer IV fluids, monitor CVP, insert pulmonary artery catheters
 - administer TPN and agents too irritating for peripheral line (e.g. vasopressors, chemotherapy)
 - common sites: internal jugular vein, subclavian vein, femoral vein
- pulmonary arterial catheter
 - balloon guides the catheter from a major vein to the right heart
 - measures pulmonary capillary wedge pressure (PCWP) via a catheter wedged in distal pulmonary artery
 - PCWP reflects the LA and LV diastolic pressure (barring pulmonary venous or mitral valve disease)
 - indications (now used infrequently due to associated complications)
 - diagnosis of shock states, primary pulmonary HTN, valvular disease, intracardiac shunts, cardiac tamponade, PE
 - assessment of hemodynamic response to therapies
 - differentiation of high- versus low-pressure pulmonary edema
 - management of complicated MI, multiorgan system failure and/or severe burns, or hemodynamic instability after cardiac surgery
 - absolute contraindications
 - tricuspid or pulmonary valve mechanical prosthesis
 - right heart mass (thrombus or tumour)
 - tricuspid or pulmonary valve endocarditis

Intensive versus Conventional Glucose Control in Critically Ill Patients

NEJM 2009; 360:1283-1297

Purpose: To assess whether intensive glucose control improves mortality in critically ill patients. Study: Prospective, randomized controlled trial.

Population: 6,104 patients expected to require ICU treatment for 3 or more consecutive days.

Intervention: Patients were randomized to insulin therapy regimens with intensive (blood glucose 4.5-6 mM) or conventional (blood glucose 10 mM or less) glucose control targets. Intravenous insulin therapy was used to maintain blood glucose in target range.

Primary Outcome: Death from any cause within 90 days after randomization.

Results: The odds ratio for death in the intensive control group was 1.14 (95% CI 1.02-1.28; P=0.02) and this effect did not differ between surgical and medical patients. Severe hypoglycemia (blood glucose <2.2 mM) was significantly more common in the intensive management group (6.8% versus 0.5%; P<0.001).

Conclusion: Intensive insulin therapy in ICU patients increased mortality compared to blood glucose targeting of less than 10 mM with a number needed to harm of 38.

Table 33. Useful Equations and Cardiopulmonary Parameters

$BSA = [Ht (cm) + Wt (kg) - 60]/100$	$PCWP = LVEDP$
$SV = CO / HR$	$SVI = CI / HR$
$CI = CO / BSA$	$RV \text{ Ejection Fraction} = SV / RVEDV$
$SVRI = [(MAP - RAP) 80]/CI$	$PP = sBP - dBP$
$P:F \text{ ratio} = P_{aO_2} / F_{iO_2}$	$MAP = 1/3 sBP + 2/3 dBP = dBP + 1/3 PP$

BSA = body surface area; CI = cardiac index; CO = cardiac output; dBP = diastolic blood pressure; HR = heart rate; LVEDP = left ventricular end diastolic pressure; MAP = mean arterial pressure; PCWP = pulmonary capillary wedge pressure; PP = pulse pressure; RAP = right atrial pressure; RVEDV = right ventricular end diastolic volume; sBP = systolic blood pressure; SV = stroke volume; SVI = stroke volume index; SVRI = systemic vascular resistance index

Organ Failure

Table 34. Types of Organ Failure

Type of Failure	Clinical Presentation	Treatment
Respiratory Failure (see Respiratory Failure, R26)	Hypoxemia Hypercapnia	Treat underlying cause (e.g. lung disease, shunt, V/Q mismatch, drug-related, cardiac) Manage mechanical ventilation settings Supplemental oxygen
Cardiac Failure (see Cardiology and Cardiac Surgery, C24)	Hypotension Decreased urine output Altered mental status Arrhythmia Hypoxia	Treat underlying cause (e.g. bradycardia, tachycardia, blood loss, adrenal insufficiency) Volume resuscitation Vasopressors Inotropes Intra-aortic balloon pump
Coagulopathy (see Hematology, H53)	Increased INR or PTT Low platelet count Bleeding, bruising	Treat underlying cause (e.g. thrombocytopenia, drug-related, immune-related, DIC) Transfusion of blood products, clotting factors
Liver Failure (see Gastroenterology, G35)	Elevated transaminases, bilirubin Coagulopathy Jaundice Altered mental status (encephalopathy) Hypoglycemia	Treat underlying cause (e.g. viral hepatitis, drug related, metabolic) Lactulose Liver transplant
Renal Failure (see Nephrology, NP37)	Elevated creatinine Reduced urine output Signs of volume overload (e.g. CHF, effusions)	Treat underlying cause (e.g. shock, drug-related, obstruction) Correct volume and electrolyte status, eliminate toxins Diuretics Dialysis

Shock

- see [Emergency Medicine, ER3](#)
- inadequate tissue perfusion potentially resulting in end organ injury
 - categories of shock
 - ♦ hypovolemic: hemorrhage, dehydration, vomiting, diarrhea, interstitial fluid redistribution
 - ♦ cardiogenic: myopathic (myocardial ischemia ± infarction), mechanical, arrhythmic, pharmacologic
 - ♦ obstructive: massive PE (saddle embolus), pericardial tamponade, constrictive pericarditis, increased intrathoracic pressure (e.g. tension pneumothorax)
 - ♦ distributive: sepsis, anaphylaxis, neurogenic, endocrine, toxins

Table 35. Changes Seen in Different Classes of Shock

	Hypovolemic	Cardiogenic	Obstructive	Distributive
HR	↑	↑, N, or ↓	↑	↑ or ↓
BP	↓	↓	↓	↓
JVP	↓	↑	↑	↓
Extremities	Cold	Cold	N or Cold	Warm
Other	Look for visible hemorrhage or signs of dehydration	Bilateral crackles on chest exam	Depending on cause, may see pulsus paradoxus, Kussmaul's sign, or tracheal deviation	Look for obvious signs of infection or anaphylaxis

- treat underlying cause (hypovolemia is the most common cause)
- treatment goal is to return critical organ perfusion to normal (e.g. normalize BP)
- common treatment modalities include
 - fluid resuscitation (NOT in cardiogenic shock)
 - inotropes (e.g. dobutamine), vasopressors (e.g. norepinephrine), vasopressin
 - revascularization or thrombolytics for ischemic events
 - needle decompression or tube thoracostomy for suspected tension pneumothorax

Sepsis

- the leading cause of death in noncoronary ICU settings is multi-organ failure due to sepsis
- the predominant theory is that sepsis is attributable to uncontrollable immune system activation

Definitions

- the Third International Consensus Definition for Sepsis and Septic Shock (Singer et al. *JAMA* 2016: 315(8), 801-810) significantly revised sepsis definitions
- sepsis: life threatening organ dysfunction caused by dysregulated host response to infection (see Table 36)
- septic shock: a subset of sepsis, where sufficient circulatory and/or cellular/metabolic abnormalities substantially increase mortality. Clinically defined as sepsis with persisting hypotension requiring vasopressors to maintain MAP ≥ 65 mmHg and having a serum lactate ≥ 2 mmol/L (18 mg/dL) despite adequate fluid resuscitation

Signs and Symptoms

- new guidelines recommend the use of quick SOFA (qSOFA) criteria and SOFA score to replace SIRS criteria
- in patients with suspected infection, bedside application of qSOFA criteria identifies individuals with high likelihood of poor outcomes, including prolonged ICU stay and/or death
- a positive qSOFA (≥ 2 criteria) should prompt application of the SOFA score, and further evaluation of possible infection and organ dysfunction
- in the context of suspected infection, a SOFA score ≥ 2 reflects an overall mortality risk of 10%
- the absence of ≥ 2 criteria on either qSOFA or SOFA score should not delay or defer investigation or treatment of infection or any other aspect of care deemed necessary by the practitioners

Causes of SHOCK

Spinal (neurogenic), Septic Hemorrhagic
 Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
 Cardiogenic (e.g. arrhythmia, MI)
 Anaphylactic

Shock: Clinical Correlation

Hypovolemic: patients have cool extremities due to peripheral vasoconstriction
Cardiogenic: patients usually have signs of left-sided heart failure
Obstructive: varied presentation
Distributive: patients have warm extremities due to peripheral vasodilation

Systemic Inflammatory Response

Syndrome (SIRS): generalized inflammatory reaction caused by infectious and noninfectious entities, manifested by two or more of:

- Body temperature $>38^{\circ}\text{C}$ or $<36^{\circ}\text{C}$
- Heart rate $>90/\text{min}$
- Respiratory rate $>20/\text{min}$ or $\text{P}_a\text{CO}_2 <32$ mmHg
- WBC $>12,000$ cells/mL or $<4,000$ cells/mL or $>10\%$ bands

Quick SOFA (qSOFA) Criteria

- Respiratory rate $\geq 22/\text{min}$
- Altered mentation
- Systolic blood pressure ≤ 100 mmHg

Table 36. Sequential (Sepsis-Related) Organ Failure Assessment (SOFA) Score

System	Score				
	0	1	2	3	4
Respiratory					
PaO ₂ /FiO ₂ , mmHg (kPa)	≥400 (53.3)	<400 (53.3)	<300 (40)	<200 (26.7) with respiratory support	<100 (13.3) with respiratory support
Coagulation					
Platelets, x10 ³ /μL	≥150	<150	<100	<50	<20
Liver					
Bilirubin, μmol/L (mg/dL)	<20 (1.2)	20-32 (1.2-1.9)	33-101 (2.0-5.9)	102-204 (6.0-11.9)	>204 (12.0)
Cardiovascular					
MAP ≥70 mmHg	MAP <70 mmHg	Dopamine <5a or dobutamine (any dose) ^a	Dopamine 5.1-15a or epinephrine <0.1a or norepinephrine <0.1a	Dopamine >15a or epinephrine >0.1a or norepinephrine >0.1a	
Central Nervous System					
Glasgow coma scale score	15	13-14	10-12	6-9	<6
Renal					
Creatinine, μmol/L (mg/dL)	<110 (1.2)	110-170 (1.2-1.9)	171-299 (2.0-3.4)	300-440 (3.5-4.9)	>440 (5.0)
Urine output, mL/d				<500	<200

^aCatecholamine doses are given as μg/kg/min for at least 1hr

Table adapted from Singer et al. The Third International Consensus Definitions for Sepsis and Septic Shock (Sepsis-3). *JAMA* 2016; 315(8): 801-810

Goal-Directed Resuscitation for Patients with Early Septic Shock

NEJM 2014; 371:1496-1506

Study: Prospective, randomized controlled trial. **Population:** 1,600 patients in Australia and New Zealand presenting to the emergency department with early septic shock.

Intervention: patients were randomized to receive early goal-directed therapy (EGDT) or usual care.

Outcome: The primary outcome was all-cause mortality within 90 days of randomization.

Results: The rate of death did not significantly differ between patients treated with EGDT or usual care (absolute risk difference EGDT versus usual care = -0.3%, 95% CI -4.1 to 3.6%; P=0.90). EGDT treated patients received more intravenous fluids, vasopressor infusions, red blood cell transfusions, and dobutamine (P<0.0001 for all). Survival time, in-hospital mortality, duration of organ support, and length of hospital stay did not significantly differ between patients randomized to EGDT or usual care. **Conclusions:** EGDT did not improve all-cause mortality at 90 days in patients presenting to the emergency department with early septic shock.

Glucocorticosteroids for sepsis: systematic review with meta-analysis and trial sequential analysis

Intens Care Med 2015;41(7):1220-1234

Study: Systematic review and trial sequential analysis of 35 randomized clinical trials.

Population: 4,682 adult patients with SIRS, sepsis, severe sepsis or septic shock.

Results: 33 of 35 trials analyzed had a high risk of bias. There was no statistically significant effect on mortality of glucocorticosteroids given at any dose when compared to placebo (RR 0.89; TSA adjusted CI 0.74-1.08). No effect was identified in subgroup analysis based on high (>500 mg) or low (<500 mg) dosing or stratification by degree of sepsis. Serious adverse events besides mortality were not altered by glucocorticosteroid treatment (RR 1.02; TSA-adjusted CI 0.7-1.48).

Conclusions: There is no definitive evidence for or against the use of glucocorticosteroids in septic patients. Larger and better designed randomized controlled trials ongoing and in future are required.

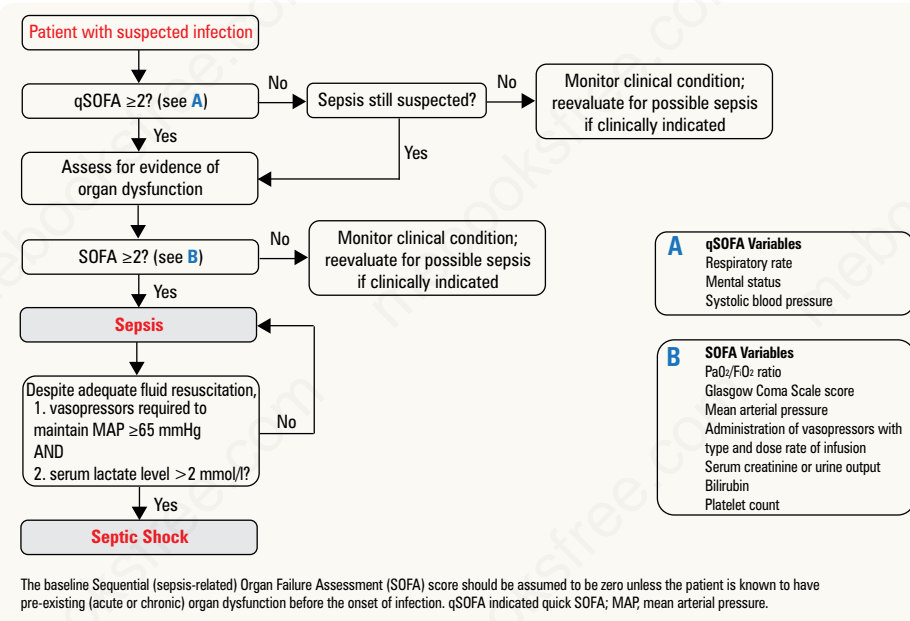

Figure 12. Approach to sepsis

Figure adapted from Singer et al. The Third International Consensus Definitions for Sepsis and Septic Shock (Sepsis-3). *JAMA* 2016; 315(8): 801-810.

Treatment

- identify the cause and source of infection: blood, sputum, urine Gram stain, and C&S
- initiate empiric antibiotic therapy
- monitor, restore, and maintain hemodynamic function

Surviving Sepsis (adapted from International Guidelines for Management of Severe Sepsis and Septic Shock 2012)

- adjustments of cardiac preload, afterload, and contractility to balance oxygen delivery with demand
- initial resuscitation (goals during first 6 h of resuscitation for sepsis induced hypotension persisting after initial fluid challenge or blood lactate ≥ 4 mmol/L)
- maintain CVP 8-12 mmHg with IV crystalloids/colloids
 - maintain MAP ≥ 65 mmHg with use of vasopressor agents, first line: norepinephrine
 - urine output ≥ 0.5 mL/kg/hr
 - central venous (SVC) or mixed oxygen saturation 70% or 65% respectively

- in patients with elevated lactate levels target resuscitation to normalize lactate
- corticosteroid replacement therapy not indicated if adequate hemodynamic stability achieved with fluid resuscitation and vasopressor therapy
- infection control
 - prompt diagnosis of infection
 - ♦ cultures as clinically indicated prior to antibiotic therapy if no significant delay
 - ♦ imaging studies performed promptly to confirm possible infectious source
 - antibiotic therapy
- administer effective IV antimicrobials within first hour of recognition of sepsis
 - choice of anti-infective therapy should consider activity against all likely pathogens and penetrance of adequate concentration into tissue presumed to be source of infection
 - antimicrobial regimen should be reassessed daily for potential deescalation
- surgical source control when appropriate
- supportive oxygenation and ventilation using lung-protective regimen
- early nutritional support: enteral route is used to preserve function of intestinal mucosal barrier
- DVT/PE prophylaxis
- advanced care planning, including the communication of likely outcome and realistic goals of treatment with patients and families

Common Medications

Table 37. Common Medications for Respiratory Diseases

	Drug	Typical Adult Dose	Indications	Side Effects
β₂-AGONISTS				
Short-Acting	salbutamol/albuterol (Ventolin [®] , Airomir [®]) (light blue/navy MDI or diskus), terbutaline (Bricanyl [®]) (blue turbuhaler)	1-2 puffs q4-6h prn	Bronchodilator in acute reversible airway obstruction	CV (angina, flushing, palpitations, tachycardia, can precipitate atrial fibrillation), CNS (dizziness, H/A, insomnia, anxiety), GI (diarrhea, N/V), rash, hypokalemia, paroxysmal bronchospasm
Long-Acting	salmeterol (Serevent [®]) (green diskus), formoterol (Oxeze [®] , Foradil [®]) (blue/green turbuhaler or aerolizer) indacaterol (Onbrez [®]) (blue/white breezhaler)	1-2 puffs bid 1 puff daily	Maintenance treatment (prevention of bronchospasm) in COPD, asthma	
Combination Long-Acting β₂-Agonist and Inhaled Corticosteroid	fluticasone and salmeterol (Advair [®]) (purple MDI or diskus) budesonide and formoterol (Symbicort [®]) (red turbuhaler) Mometasone and formoterol (Zenhale [®]) (blue MDI)	1 puff bid 2 puffs bid	COPD and asthma	Common: CNS, H/A, dizziness Resp: URTI, GI (N/V, diarrhea, pain/discomfort, oral candidiasis)
Combination Short-Acting β₂-Agonist and Short-Acting Anti-Cholinergic	ipratropium/salbutamol (Combivent [®] , Respimat [®]) (orange respimat)	1 puff qid	Bronchodilator used in COPD	Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs
Combination Long-Acting β₂-Agonist and Long-Acting Anti-Cholinergic	umeclidinium/vilanterol (Anoro [®]) (red ellipta) aclidinium/formoterol (Duaklir [®]) (yellow genuair) tiotropium/olodaterol (Inspiro [®]) (green respimat) indacaterol/glycopyrronium (Ultibro [®]) (yellow breezhaler)	1 puff daily 1 puff bid 1 puff daily 1 puff daily	Bronchodilator used in COPD	Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs
ANTICHOLINERGICS				
Short-Acting Anti-Cholinergic	ipratropium bromide (Atrovent [®]) (clear/green MDI)	2-3 puffs qid	Bronchodilator used in asthma and COPD	Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs
Long-Acting Anti-Cholinergic	tiotropium bromide (Spiriva [®]) (green handihaler or respimat) glycopyrronium bromide (Seebri [®]) (orange breezhaler), umeclidinium (Incruse [™]) (green ellipta), aclidinium (Genuair [®] , Tudorza [®]) (green inhaler)	1 puff qam 1 puff daily	Bronchodilator used in asthma and COPD	Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drug

Table 37. Common Medications for Respiratory Diseases (continued)

	Drug	Typical Adult Dose	Indications	Side Effects
CORTICOSTEROIDS				
Inhaled	fluticasone (Flovent®) (orange/peach MDI or diskus)	2-4 puffs bid	Maintenance treatment of asthma	H/A, fever, N/V, MSK pain, URTI, throat irritation, growth velocity reduction in children/adolescents, HPA axis suppression, increased pneumonia risk in COPD
	budesonide (Pulmicort®) (brown turbuhaler)	2 puffs bid		
	ciclesonide (Alvesco®) (red MDI)	1 puff daily or bid		
	beclomethasone (QVAR®, Vanceril®) (brown MDI), mometasone (Asmanex®) (pink/grey/brown twisthaler)	1-4 puffs bid		
	fluticasone furoate (Arnuity®) (orange ellipta)	1 puff daily or bid		
		1 puff daily		
Systemic	prednisone (Apo-prednisone®, Deltasone®) methylprednisolone (Depo-Medrol®, Solu-Medrol®)	Typically 40-60 mg per day PO 125 mg q8h IV (sodium succinate) loading dose 2 mg/kg then 0.5-1 mg/kg q6h for 5 d	Acute exacerbation of COPD; severe, persistent asthma, PCP Status asthmaticus	Endocrine (hirsutism, DM/glucose intolerance, Cushing's syndrome, HPA axis suppression), GI (increased appetite, indigestion), ocular (cataracts, glaucoma), edema, AVN, osteoporosis, H/A, psychiatric (anxiety, insomnia), easy bruising
ADJUNCT AGENTS				
	theophylline (Uniphyll®)	400-600 mg OD	Treatment of symptoms of reversible airway obstruction due to COPD	GI upset, diarrhea, N/V, anxiety, H/A, insomnia, muscle cramp, tremor, tachycardia, PVCs, arrhythmias Toxicity: persistent, repetitive vomiting, seizures
LEUKOTRIENE ANTAGONISTS				
	montelukast (Singular®) zafirlukast (Accolate®)	10 mg PO qhs, now only available as once daily slow release 20 mg bid	Prophylaxis and chronic treatment of asthma	H/A, dizziness, fatigue, fever, rash, dyspepsia, cough, flu-like symptoms
ANTI-IgE MONOCLONAL ANTIBODIES				
	omalizumab (Xolair®)	150-375 mg SC q2-4wk	Moderate-severe persistent asthma	H/A, sinusitis, pharyngitis, URTI, viral infection, thrombocytopenia, anaphylaxis
PDE-4 INHIBITORS				
	roflumilast (Daxas®)	500 µg PO OD	Severe emphysema, with frequent exacerbations	Weight loss, suicidal ideation
ANTIBIOTICS – COMMUNITY ACQUIRED PNEUMONIA				
Macrolide	erythromycin	250-500 mg PO tid x 7-10 d	Alternate to doxycycline or fluoroquinolone	GI (abdominal pain, diarrhea, N/V), H/A, prolonged QT, ventricular arrhythmias, hepatic impairment GI (diarrhea, N/V, abdominal pain), renal failure, deafness H/A, rash, GI (diarrhea, N/V, abnormal taste, heartburn, abdominal pain), increased urea
	azithromycin	500 mg PO x 1 dose, then		
	clarithromycin	250 mg OD x 4 1,000 mg od or 500 mg PO bid x 7-10 d		
Doxycycline		100 mg PO bid x 7-10 d	Alternate to macrolide or fluoroquinolone	Photosensitivity, rash, urticaria, anaphylaxis, diarrhea, enterocolitis, tooth discoloration in children
Fluoroquinolone	levofloxacin (Levaquin®) moxifloxacin (Avelox®)	500 mg PO OD x 7-10 d 400 mg PO OD x 7 d	Alternate to macrolide or doxycycline	CNS (dizziness, fever, H/A), GI (N/V, diarrhea, constipation), prolonged QT

Table 37. Common Medications for Respiratory Diseases (continued)

Drug	Typical Adult Dose	Indications	Side Effects	
ANTIBIOTICS – HOSPITAL ACQUIRED PNEUMONIA				
3rd gen Cephalosporin	ceftriaxone (Rocephin®)	1-2 g IV OD x 7-10 d	Combine with fluoroquinolone or macrolide	Rash, diarrhea, eosinophilia, thrombocytosis, leukopenia, elevated transaminases
Fluoroquinolone	levofloxacin moxifloxacin	750 mg PO OD x 5 d 400 mg PO OD x 7 d (5 d for AECOPD)	Combine with 3rd gen cephalosporin	See above
Piperacillin/Tazobactam (Tazocin®)		4.5 g IV q6-8h x 7-10 d	Suspect <i>Pseudomonas</i>	CNS (confusion, convulsions, drowsiness), rash Hematologic (abnormal platelet aggregation, prolonged PT, positive Coombs)
Vancomycin (Vancocin®)		1 g IV bid x 7-10 d	Suspect MRSA	CNS (chills, drug fever), hematologic (eosinophilia), rash, red man syndrome, interstitial nephritis, renal failure, ototoxicity
Macrolide	azithromycin clarithromycin	500 mg IV OD x 2 d, then 500 mg PO OD x 5 d 1,000 mg od or 500 mg PO bid x 7-10 d	Suspect <i>Legionella</i>	See above
ICU MEDICATIONS				
Pressors/Inotropes	norepinephrine (Levophed®) phenylephrine dobutamine	0.5-30 µg/min IV 0.5 µg/kg/min IV 2-20 µg/kg/min IV	Acute hypotension Severe hypotension Inotropic support	Angina, bradycardia, dyspnea, hyper/hypotension, arrhythmias See above
Sedatives/Analgesia	fentanyl (opioid class) propofol (anesthetic)	50-100 µg then 50-unlimited µg/h IV 1-3 mg/kg then 0.3-5 mg/ kg/h IV	Sedation and/or analgesia Sedation and/or analgesia	Bradycardia, respiratory depression, drowsiness, hypotension Apnea, bradycardia, hypotension (good for ventilator sedation)

See [Infectious Diseases, ID26](#) – for the management of pulmonary tuberculosis

Landmark Respiriology Trials

Trial	Reference	Results
ARDS Network	<i>NEJM</i> 2000;342:1301-8	Mortality decreased in ARDS patients ventilated with a low tidal volume strategy
Berlin Criteria	<i>JAMA</i> 2012;307:2526-33	The new definition of ARDS, better predicts mortality
CPAP and Apnea	<i>NEJM</i> 2005;353:2025-33	CPAP ameliorates symptoms of sleep apnea but does not affect mortality in CHF
EINSTEIN-PE	<i>NEJM</i> 2012;366:1287-97	Fixed dose of rivoxabarin was non-inferior to standard therapy (Vit K antagonist) initial and long-term treatment of PE
Emphysema Treatment Trial	<i>NEJM</i> 2003;348:2059-73	Lung volume reduction surgery benefits patients with upper lobe disease and low exercise capacity
IELCAP	<i>NEJM</i> 2006;355:1763-71	High survival rate in patients with early stage lung cancer detected by low dose CT screening
Lung Health	<i>JAMA</i> 1994;272:1497-505	Aggressive smoking intervention significantly decreases the age-related decline in FEV ₁ in middle-aged smokers with mild airways obstruction
OSCILLATE	<i>NEJM</i> 2013;368: 795-805	Early high-frequency oscillatory ventilation in patients with moderate to severe ARDS might increase in-hospital mortality
ILD	<i>NEJM</i> 1978;298:801-9	Interstitial lung disease subsets have different prognoses and response to treatment (e.g. desquamative but not usual interstitial pneumonia respond well to corticosteroids)
POET-COPD	<i>NEJM</i> 2011;364:1093-103	Tiotropium decreases the number of moderate-to-severe exacerbations in comparison to salmeterol
REDUCE	<i>JAMA</i> 2013;309: 2223-2231	5 d course of glucocorticoids is non-inferior to a 14 d course for treatment of acute COPD exacerbations
ROFLUMILAST	<i>Lancet</i> 2009;374:695-703	Phosphodiesterase-4 inhibitor improves FEV ₁ when used as add-on therapy in COPD patients on tiotropium or salmeterol
TORCH	<i>NEJM</i> 2007;356:775-89	Combination of inhaled steroids and long-acting β 2-agonists improves COPD symptoms, reduces exacerbations, and shows a trend to lowers mortality
UPLIFT	<i>NEJM</i> 2008;359:1543-54	Tiotropium improves symptoms of COPD with fewer exacerbations, but does not affect FEV ₁ decline

Anatomy of Joint Pathology

Figure 1. Structure of normal, degenerative, and inflammatory joint

Basics of Immunology

Immune Mechanisms of Disease

Table 1. Mechanisms of Immune-Mediated Disorders

Type	Pathophysiology	Examples
Immediate Hypersensitivity (Type I)	Formation of IgE → release of immunologic mediators from basophils/mast cells → diffuse inflammation	Asthma Allergic rhinitis Anaphylaxis
Cytotoxic (Type II)	Formation of Ab → deposit and bind to Ag on cell surface → phagocytosis or lysis of target cell	Autoimmune hemolytic anemia, Anti glomerular membrane disease (Goodpasture's syndrome), Graves' disease, pemphigus vulgaris, rheumatic fever, ITP
Immune Complex (Type III)	Formation and deposition of Ag-Ab complexes → activate complement → leukocyte recruitment and activation → tissue injury	SLE, PAN, post-streptococcal glomerulonephritis, serum sickness, viral hepatitis
Cell-Mediated/Delayed Hypersensitivity (Type IV)	Release of cytokines by sensitized T-cells and T-cell mediated cytotoxicity	Contact dermatitis, insect venom, mycobacterial proteins

Immunogenetics and Disease

- cell surface molecules called HLAs play a role in mediating immune reactions
- MHC are genes on the short arm of chromosome 6 that encode HLA molecules
- certain HLA haplotypes are associated with increased susceptibility to autoimmune diseases

Terminology in Rheumatology

Arthritis

- Joint swelling: effusion/synovial thickening
- Decreased ROM
- Stress pain (pain at the end of ROM)
- Increased warmth

Arthralgia: perception of joint pain without obvious clinical findings

Active Joint: swollen joint, joint line tenderness, or stress pain

Innate Immune Cells

- Neutrophil (PMN):** circulate in blood and respond to inflammatory stimuli, kill invading organisms by phagocytosis, degranulation and neutrophil extracellular traps
- Natural Killer Cell:** innate immunity against intracellular infections (especially viruses), killing function and produce cytokines
- Macrophage:** arrive after PMNs, suppress PMN efflux and phagocytose PMN debris, secrete pro-inflammatory cytokines in response to microbial debris
- Dendritic Cell:** actively phagocytic when immature, activated by signals from toll-like receptor (TLR), release pro-inflammatory cytokines, present antigens to T cells in lymph nodes
- Eosinophil:** respond to inflammatory cytokines and degranulate releasing reactive oxygen species, and cytokines, associated with allergy, asthma and parasitic infection
- Mast Cell:** present in connective tissue and mucosa, allergen cross-linking of IgE bound to mast cell triggers degranulation and release of inflammatory mediators

Key Cytokine Targets of Biologic Drugs

- TNF**
- Source:** T cells, macrophages
- Major Functions:** cachexia, induces other cytokines, T cell stimulation, induces metalloproteinases and prostaglandins, increases expression of adhesion molecules, increases vascular permeability leading to increased entry of IgG, complement and cells into tissues

IL-6

- Source:** Many cells
- Major Functions:** proliferation of B and T cells, acute phase reactant, induces natural protease inhibitor

Table 2. Classes of MHCs

MHC Class	Types	Location	Function
I	HLA-A, B, C	All cells	Recognized by CD8+ (cytotoxic) T-lymphocytes
II	HLA-DP, DQ, DR	Ag presenting cells (mononuclear phagocytes, B cells, etc.)	Recognized by CD4+ (helper) T-lymphocytes
III	Some components of the complement cascade	In plasma	Chemotaxis, opsonization, lysis of bacteria and cells

Table 3. HLA-Associated Rheumatic Disease

HLA Type	Associated Conditions	Comments
B27	Ankylosing Spondylitis (AS) Reactive Arthritis (ReA) Enteropathic arthritis (EA)	Relative risk 20x for developing AS and ReA
DR4, DR1	Rheumatoid Arthritis (RA)	In RA, relative risk = 2-10x; found in 93% of patients
DR3	Sjögren's syndrome (SS) Systemic Lupus Erythematosus (SLE)	DR3 is associated with the production of anti-Ro/SSA and anti-La/SSB antibodies

Adaptive Immune Cells

- **B Cell:** produce antibodies after activation by specific antigen and B-cell co-receptor, additional signals provided by CD4 T helper cells
- **Cytotoxic T Cell:** CD8, direct cytotoxicity of target cells at sites of infection, kill via lytic granules and FasL-Fas interaction, recognize specific antigen and MHC1
- **Helper T Cell:** subset of CD4 cells, activate and help other types of cells carry out immune defense (activate macrophages, help B cells, release cytokines)
- **Regulatory T Cell:** subset of CD4 cells, suppress activation of naïve autoreactive T cells

Differential Diagnoses of Common Presentations

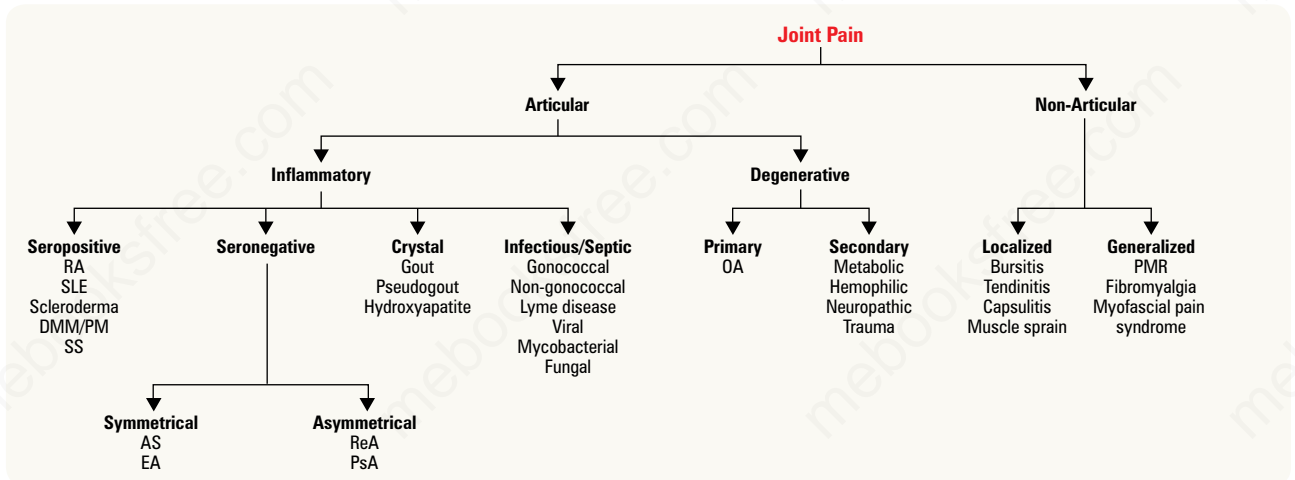

Figure 2. Clinical approach to joint pain

Table 4. Differential Diagnosis of Monoarthritis

ACUTE MONOARTHRTIS			
Non-Inflammatory	Inflammatory	Infectious	Hemorrhagic
Trauma	Crystal induced Monosodium urate (MSU-gout) Calcium pyrophosphate dehydrate (CPPD) or pseudogout Hydroxyapatite (HA)	Non-crystal induced Seropositive Seronegative	<i>S. aureus</i> , GC Trauma, fracture, blood dyscrasias and anticoagulants Congenital clotting disorders e.g. hemophilia
CHRONIC MONOARTHRTIS			
Non-Inflammatory	Inflammatory	Infectious	Hemorrhagic
OA and osteonecrosis	seropositive and seronegative	TB and fungi	Tumour

Causes of Joint Pain

SOFTER TISSUE

- Sepsis
- OA
- Fracture
- Tendon/muscle
- Epiphyseal
- Referred
- Tumour
- Ischemia
- Seropositive arthritides
- Seronegative arthritides
- Urate (gout)/other crystal
- Extra-articular rheumatism (PMR/fibromyalgia)

Table 5. Differential Diagnosis of Oligoarthritis/Polyarthritis

ACUTE (<6 wk)	CHRONIC (>6 wk)		
Post-viral infection (parvovirus B19, HIV) Post bacterial Infection (GC and non-GC, rheumatic fever) Crystal induced Other (sarcoidosis, lyme disease)	Seropositive inflammatory arthritis RA SLE Scleroderma DMM/PM	Seronegative inflammatory arthritis AS EA PsA ReA Crystal (polyarticular gout)	Degenerative OA

Patterns of Joint Involvement

- Symmetrical vs. asymmetrical
- Small vs. large
- Mono vs. oligo (2-4 joints) vs. polyarticular (≥5 joints)
- Axial vs. peripheral

Table 6. Symptoms of Inflammatory Arthritis vs. Degenerative Arthritis

Inflammatory	Degenerative
Pain at rest, relieved by motion	Pain with motion, relieved by rest
Morning stiffness >1 h	Morning stiffness <1/2 h
Warmth, swelling, erythema	Joint instability, buckling, locking
Malalignment/deformity	Bony enlargement, malalignment/deformity
Extra-articular manifestations	Evening pain
Nighttime awakening	

Table 7. Seropositive vs. Seronegative Rheumatic Diseases

	Seropositive	Seronegative
Demographics	F > M	M > F
Peripheral Arthritis	Symmetrical Small (PIP, MCP) and medium joints (wrist, knee, ankle, elbow) common DIP less often involved	Usually asymmetrical Usually larger joints, lower extremities (exception: PsA) DIP in PsA Dactylitis ("sausage digit")
Pelvic/Axial Disease	No (except for C-spine)	Yes
Enthesitis	No	Yes
Extra-Articular	Nodules Vasculitis Sicca Raynaud's phenomenon Rashes, internal organ involvement (lung, cardiac)	Iritis (anterior uveitis) Oral ulcers Gastrointestinal Dermatologic features Genitourinary inflammation

The presence of synovitis often indicates articular as opposed to non-articular joint pain; synovitis presents with: soft tissue swelling, effusion, warmth, and pain with movement

**CRP****Advantages**

- Unaffected by age/gender
- Rapid response to inflammatory stimulus
- Wide range of clinically relevant values
- Can be measured on stored sera
- Quantification precise/reproducible

Disadvantages

- More expensive

Synovial Fluid Analysis

- synovial fluid is an ultrafiltrate of plasma plus hyaluronic acid; it lubricates joint surfaces and nourishes articular cartilage

Indications

- diagnostic tests advised if crystal arthritis or hemoarthritis is suspected or if there is unexplained joint, bursa or tendon sheath swelling
- therapeutic: drainage of blood, purulent or tense effusions; corticosteroid injection

Contraindications

- absolute: open lesion or suspected infection of overlying skin or soft tissue
- relative: bleeding diathesis, thrombocytopenia, prosthetic joint

Synovial Fluid Analysis

- most important to assess the 3Cs: culture and order gram stain, cell count (WBC) and differential, and crystal analysis
- other parameters to consider are listed in Table 8

Table 8. Synovial Fluid Analysis

Parameter	Normal	Non-Inflammatory	Inflammatory	Infectious	Hemorrhagic
Colour	Pale yellow	Pale yellow	Pale yellow	Yellow to white	Red/brown
Clarity	Clear	Clear	Opaque	Opaque	Sanguinous
Viscosity	High (due to hyaluronic acid)	High	Low	Low or paradoxically high if purulent	Variable
WBC/mm³	<200	<2,000	≥2,000	Higher cell counts (particularly >50,000) suggestive	Variable
% PMN	<25%	<25%	≥25%	>75%	Variable
Culture/Gram Stain	–	–	–	Usually positive	–
Examples		Trauma OA Neuropathy Hypertrophic – arthropathy	Seropositive Seronegative Crystal arthropathies	<i>S. aureus</i> Gram negative GC → difficult to culture	Trauma Hemophilia

**Most Important Tests of Synovial Fluid (3 Cs)**

1. Culture and gram stain
2. Cell count and differential
3. Crystal examination (protein, LDH, glucose less helpful)

**Choosing Wisely Canada Recommendations**

1. Do not order ANA as a screening test in patients without specific signs or symptoms of SLE or another CTD
2. Do not order an HLA-B27 unless spondyloarthritis is suspected based on specific signs or symptoms
3. Do not repeat DEXA scans more often than every 2 years
4. Do not prescribe bisphosphonates for patients at low risk of fracture
5. Do not perform whole body bone scans (e.g. scintigraphy) for diagnostic screening for peripheral and axial arthritis in the adult population

Septic Arthritis

- septic arthritis is a medical emergency because it can lead to rapid joint destruction and has a 10-15% risk of mortality
- knee and hip are most commonly affected joints
- most commonly caused by hematogenous spread of bacterial infection (gram positive cocci > gram negative bacilli)
- risk factors: very young, portal of entry, recent infection
- poor prognostic factors: older age, immunocompromised, delay in treatment, previously damaged joint, joint prosthesis
- consider empiric antibiotic therapy until septic arthritis is excluded from history, physical examination and synovial fluid analysis
- see [Infectious Diseases](#), [Gonococcal Arthritis ID14](#) and [Orthopedics](#), [Septic Joint OR10](#)

Septic arthritis is a medical emergency; it leads to rapid joint destruction, and there is a 10-15% risk of mortality

OA of MCP joints can be seen in hemochromatosis or CPPD-related disease (chondrocalcinosis)

ESR can also be elevated in anemia, end-stage renal disease, females, increased age, and obesity

Degenerative Arthritis: Osteoarthritis

- see [Family Medicine](#), FM40

Definition

- progressive deterioration of articular cartilage and surrounding joint structures caused by genetic, metabolic, biochemical, and biomechanical factors with secondary components of inflammation

Classification (Based on Etiology)

- primary (idiopathic)
 - most common, unknown etiology
- secondary
 - post-traumatic or mechanical
 - post-inflammatory (e.g. RA) or post-infectious
 - heritable skeletal disorders (e.g. scoliosis)
 - endocrine disorders (e.g. acromegaly, hyperparathyroidism, hypothyroidism)
 - metabolic disorders (e.g. gout, pseudogout, hemochromatosis, Wilson's disease, ochronosis)
 - neuropathic (e.g. Charcot joints)
 - ♦ atypical joint trauma due to peripheral neuropathy (e.g. diabetes mellitus, syphilis)
 - avascular necrosis (AVN)
 - other (e.g. congenital malformation)

Pathophysiology

- the process appears to be initiated by abnormalities in biomechanical forces and/or, less often, in cartilage
- elevated production of pro-inflammatory cytokines is important in OA progression
- tissue catabolism > repair
- contributing factors (mechanisms unknown): genetics, alignment (bow-legged, knock-kneed), joint deformity (hip dysplasia), joint injury (meniscal or ligament tears), obesity, environmental, mechanical loading, age and gender
- now considered to be a systemic musculoskeletal disorder rather than a focal disorder of synovial joints

Epidemiology

- most common arthropathy (accounts for ~75% of all arthritis)
- increased prevalence with increasing age (35% of 30 yr olds, 85% of 80 yr olds)

Risk Factors

- genetic predisposition, advanced age, obesity (for knee and hand OA), female, trauma

Signs and Symptoms

- localized to affected joints (not a systemic disease)
- pain is often insidious, gradually progressive, with intermittent flares and remissions; neuropathic pain may also be present
- fatigue, poor sleep, impact on mood (depression, anxiety)

Table 9. Signs and Symptoms of OA

Signs	Symptoms
Joint line tenderness; stress pain ± joint effusion	Joint pain with motion; relieved with rest
Bony enlargement at affected joints	Short duration of stiffness (<1/2 h) after immobility
Malalignment/deformity (angulation)	Joint instability/buckling
Limited ROM	Joint locking due to "joint mouse" (bone or cartilage fragment)
Crepitus on passive ROM	Loss of function or other internal derangements (e.g. meniscal tear)
Inflammation (mild if present)	
Periarticular muscle atrophy	

- Hand (DIP, PIP, 1st CMC)
- Hip
- Knee
- 1st MTP
- L-spine (L4-L5, L5-S1)
- C-spine
- Uncommon: ankle, shoulder, elbow, MCP, rest of wrist

© Linda Colari

Figure 3. Common sites of joint involvement in OA

1. Thumb squaring
2. Heberden's nodes
3. Bouchard's nodes

© Tabby Lulham

Figure 4. Hand findings in OA

Joint Involvement

- generalized osteoarthritis: 3+ joint groups
- asymmetric (knees usually affected bilaterally)
- hand
 - DIP (Heberden's nodes = osteophytes → enlargement of joints)
 - PIP (Bouchard's nodes)
 - CMC (usually thumb squaring)
 - 1st MCP (other MCPs are usually spared)
- hip
 - usually presents as groin pain ± dull or sharp pain in the trochanteric area, internal rotation and abduction are lost first
 - pain can radiate to the anterior thigh, but generally does not go below the knee
- knee
 - initial narrowing of one compartment, medial > lateral; seen on standing x-rays, often patellar-femoral joint involved
- foot
 - common in first MTP and midfoot
- lumbar spine
 - very common, especially L4-L5, L5-S1
 - degeneration of intervertebral discs and facet joints
 - reactive bone growth can contribute to neurological impingement (e.g. sciatica, neurogenic claudication) or spondylolisthesis (forward or backward movement of one vertebra over another)
- cervical spine
 - commonly presents with neck pain that radiates to scapula, especially in mid-lower cervical area (C5 and C6)

Investigations

- blood work
 - normal CBC and ESR, CRP
 - negative RF and ANA
- radiology: 4 hallmark findings, see sidebar
- synovial fluid: non-inflammatory (see Table 8)

Treatment

- presently no treatment alters the natural history of OA
- prevention: prevent sports injury, healthy weight management
- **non-pharmacological therapy**
 - weight loss (minimum 5-10 lb loss) if overweight
 - physiotherapy: heat/cold, low impact exercise programs
 - occupational therapy: aids, splints, cane, walker, bracing
- **pharmacological therapy** (see Table 33)
 - 1st line- oral: acetaminophen/NSAIDs
 - treat neuropathic pain if present (anti-depressants, anti-epileptics, etc.)
 - joint injections: corticosteroid (effective for short-term treatment), hyaluronic acid (evidence of long-term benefits)
 - topical: capsaicin, NSAIDs
 - glucosamine ± chondroitin (efficacy not well supported)
- **surgical treatment**
 - joint debridement, osteotomy, total and/or partial joint replacement, fusion (see Orthopedics, OR6)

Differential Diagnosis of Elevated ESR

- Systemic inflammatory diseases
- Localized inflammatory diseases
- Malignancy
- Trauma
- Infection
- Tissue injury/ischemia

The Radiographic Hallmarks of OA

- Joint space narrowing
- Subchondral sclerosis
- Subchondral cysts
- Osteophytes

Seropositive Rheumatic Disease

- diagnosis vs. classification in rheumatology
 - diagnostic criteria are often dependent on disease progression and evolution over time, as early objective measures are often unavailable
 - classification criteria are derived from studying patients with long-term diseases and clear diagnoses in order to determine which criteria have good specificity in the early prediction of certain diagnoses
- seropositive arthropathies are characterized by the presence of a serologic marker such as positive RF or ANA
- a small subset of the vasculitides, the small vessel ANCA-associated vasculitides, have a measurable serological component, but they are often considered a separate entity from seropositive disease by experts

Table 10. Autoantibodies and their Prevalence in Rheumatic Diseases

Autoantibody	Disease	Healthy Controls	Comments
RF	RA 80% SS 50% SLE 20%	<5% 10-20% > 65	Autoantibodies directed against Fc domain of IgG Sensitive in RA (can be negative early in disease course), levels correlate with disease activity Present in most seropositive diseases Non-specific; may be present in IE, TB, hepatitis C, silicosis, sarcoidosis
Anti-CCP	RA 80%		Specific for RA (94-98%) May be useful in early disease and to predict aggressive disease
ANA	SLE 98% MCTD 100% SS 40-70% CREST 60-80%	High titers <5% Low titers Up to 30% (Often seen in other CTDs)	Ab against nuclear components (DNA, RNA, histones, centromere) Sensitive but not specific for SLE Given high false positive rate -only measure when high pre-test probability of CTD
Anti-dsDNA	SLE 50-70%	0%	Specific for SLE (95%) Levels correlate with disease activity (i.e. SLE flare)
Anti-Sm	SLE <30%	0%	Specific but not sensitive for SLE Does not correlate with SLE disease activity If positive, will remain positive through disease course
Anti-Ro (SSA)	SS 40-95% SSc 21% SLE 32% RA 15%	0.5%	Subacute cutaneous SLE (74%) May be only Ab present in ANA negative SLE Increases risk of having child with neonatal lupus syndrome
Anti-La (SSB)	SS 40% SLE 10%	0%	Usually occurs with anti-Ro Specific for SS and SLE when anti-Ro is also positive Increases risk of having child with neonatal lupus syndrome
Antiphospholipid Ab (LAC, aCLA, aB₂GP)	APLS 100% SLE 31-40%	<5%	By definition present in APLS Only small subset of SLE patients develop clinical syndrome of APLA If positive, will often get a false positive VDRL test
Anti-Histone	Drug-induced SLE 95% SLE 30-80%	0% 0%	Highly specific for drug-induced SLE
Anti-RNP	MCTD SLE		High titres present in MCTD; present in many other CTD (especially SLE)
Anti-Centromere	CREST >80%	0%	Specific for CREST, cutaneous variant of systemic sclerosis
Anti-Topoisomerase I (formerly Scl-70)	Diffuse SSc 26-76%	0%	Specific for SSc Increased risk pulmonary fibrosis in SSc
Anti-Jo1	PM DMM	0%	Less frequent for DMM
c-ANCA	Active GPA >90%	0%	Specific and sensitive
p-ANCA	GPA 10% Other vasculitis	0%	Nonspecific and poor sensitivity (found in ulcerative colitis, PAN, microscopic polyangiitis, Churg-Strauss, rapidly progressive glomerulonephritis)
Anti-Mi-2	DMM 15-20%		Specific but not sensitive (not available in all centres)
Anti-Topoisomerase I (formerly Scl-70)	Diffuse SSc 26-76%	0%	Specific for SSc Increased risk pulmonary fibrosis in SSc
Anti-Jo1	PM DMM	0%	Less frequent for DMM
c-ANCA	Active GPA >90%	0%	Specific and sensitive
p-ANCA	GPA 10% Other vasculitis	0%	Nonspecific and poor sensitivity (found in ulcerative colitis, PAN, microscopic polyangiitis, Churg-Strauss, rapidly progressive glomerulonephritis)
Anti-Mi-2	DMM 15-20%		Specific but not sensitive (not available in all centres)
Ab Against RBCs, WBCs, or Platelets	SLE		Perform direct antiglobulin test (DAT) Test Hb, reticulocyte, leukocyte and platelet count, antiplatelet Abs
Anti-mitochondria	Primary biliary cholangitis	0%	Sensitive and specific

Note: some individuals in the normal population test positive for RF and/or ANA, but do not have the conditions listed above

Connective Tissue Disorders

Table 11. Features of Seropositive Arthropathies

	RA	SLE	Scleroderma	Dermatomyositis
CLINICAL FEATURES				
History	Symmetrical polyarthritits (small joint involvement) Morning stiffness (>1 h)	Multisystemic disease: rash, photosensitivity, Raynaud's, alopecia, cardiac and pulmonary serositis, CNS symptoms, glomerulonephritis	Skin tightness, stiffness of fingers, Raynaud's, heartburn, dysphagia, pulmonary HTN, renal crisis with new onset HTN or hypertensive urgency/emergency, dyspnea on exertion	Heliotrope rash (periorbital), Gottron's papules (violaceous papules over knuckles and IP joints) ± poikiloderma Shawl sign: macular erythema over chest and shoulder Proximal muscle weakness ± pain Dyspnea on exertion
Physical Examination	Effused joints Tenosynovitis Subcutaneous nodules Joint deformities Bone-on-bone crepitus in advanced disease	Confirm historical findings (rash, serositis, renal, CVS, etc.) ± effused (typically small) joints (can be minimal, look for soft tissue swelling)	Skin tightness on dorsum of hand, facial skin tightening, telangiectasia, calcinosis, non-effused joint, inspiratory crackles	Rash, proximal muscle weakness, inspiratory crackles
LABORATORY				
Non-Specific	↑ ESR in 50-60% ↑ Platelets ↓ Hb	↑ ESR ↓ Platelets (autoimmune) ↓ Hb (autoimmune) ↓ WBC (leukopenia, lymphopenia)	↑ ESR ↓ Hb Normal WBC	Possible increased ESR ↓ Hb Normal WBC
Specific	RF +ve in ~80% Anti-CCP +ve in ~80%	ANA +ve in 98% Anti-dsDNA +ve in 50-70% Anti-SM +ve in 30% ↓ C3, C4, total hemolytic complement False positive VDRL (in SLE subtypes) ↑ PTT (in SLE subtypes, e.g. APLA)	ANA +ve in >90% Anti-topoisomerase 1 (diffuse) Anti-centromere (usually in <i>CREST</i> , see RH13)	CK elevated in 80% ANA +ve in 33% Anti-Jo-1, anti-Mi-2 Muscle biopsy EMG MRI
Radiographs	Periarticular osteopenia Joint space narrowing Erosions Absence of bone repair Symmetric/concentric	Non-erosive ± Osteopenia ± Soft tissue swelling	± Pulmonary fibrosis ± Esophageal dysmotility ± Calcinosis ± ILD	± Esophageal dysmotility ± ILD ± Calcifications

Rheumatoid Arthritis

Definition

- chronic, symmetric, erosive synovitis of peripheral joints (e.g. wrists, MCPs, MTPs)
- characterized by a number of extra-articular features

Table 12. 2010 ACR/EULAR Classification Criteria for RA

Criteria	Score	Comments
1. Joint involvement (swollen or tender)		
1 large joint (shoulders, elbows, hips, knees, and ankles)	0	
2-10 large joints	1	
1-3 small joints (MCPs, PIPs, wrists, 2nd-5th MTPs)	2	
4-10 small joints	3	
>10 joints (at least 1 small joint)	5	
2. Serology		Total score of ≥6: definite RA Must have ≥1 joint with definite clinical swelling, not better explained by other disease
Negative RF and negative Anti-CCP	0	
Low-positive RF or low-positive Anti-CCP (<3x ULN)	2	
High-positive RF or high-positive Anti-CCP (>3x ULN)	3	
3. Acute phase reactants		
Normal CRP and normal ESR	0	
Abnormal CRP and abnormal ESR	1	
4. Duration of symptoms		
<6 wk	0	
≥6 wk	1	

Arthritis Rheum 2010;62:2569-2581

RA is an independent risk factor for atherosclerosis and CV disease. RA is associated with increased overall mortality/morbidity from all causes: CV disease, neoplasm (especially lymphoma), infection

Common Presentation

- Morning stiffness >1 h, improves with use
- Symmetric joint involvement
- Initially involves small joints of hands and feet
- Constitutional symptoms

Pathophysiology

- autoimmune disorder, unknown etiology
- complex interaction of genes and environment leading to breakdown of immune tolerance; many pathways result in autoreactivity leading to a final common pathway to synovial inflammation
 - genetic predisposition: HLA-DR4/DR1 association (93% of patients have either HLA type), cytokine promoters, T cell signaling
 - ♦ induction of enzymes that convert arginine to citrulline caused by environmental stress (cigarette smoking)
 - ♦ RA: propensity for immune reactivity to neoepitopes created by protein citrullination and production of anti-citrullinated protein antibodies
- once inflammatory process is established, synovium organizes itself into an invasive tissue that degrades cartilage and bone
- progressive bone destruction with absence of bone repair in response to inflammation
 - elevated TNF level increases osteoclasts and decreases osteoblasts at the site of inflammation
 - upregulation of RANK ligand increases osteoclast-mediated destruction

Epidemiology

- most common inflammatory arthritis: prevalent in 1% of population
- F:M = 3:1
- age of onset 20-40 yr

Signs and Symptoms

- variable course of exacerbations and remissions
- morning stiffness >1 h, improves with use, worsens with rest
- polyarthritis: symmetric joint involvement (tender, swollen), small joints affected, most commonly in hands and feet (MCP, PIP, MTP)
- extra-articular (systemic) symptoms: profound fatigue, depression, myalgia, weight loss
- limitation of function and decrease in global functional status
- complications of chronic synovitis
 - signs of mechanical joint damage: loss of motion, instability, deformity, crepitus, joint deformities
 - ♦ swan neck deformity, boutonnière deformity
 - ♦ ulnar deviation of MCP, radial deviation of wrist joint
 - ♦ hammer toe, mallet toe, claw toe
 - ♦ flexion contractures
 - atlanto-axial and subaxial subluxation
 - ♦ C-spine instability
 - ♦ neurological impingement (long tract signs)
 - ♦ difficult/dangerous intubation: risk of worsening subluxation and damage to spinal cord
- limited shoulder mobility, spontaneous tears of the rotator cuff leading to chronic spasm
- tenosynovitis → may cause rupture of tendons
- carpal tunnel syndrome
- ruptured Baker's cyst (outpouching of synovium behind the knee); presentation similar to acute DVT
- poor prognostic factors include: young age of onset, high RF titer, elevated ESR, activity of >20 joints, and presence of extra-articular features

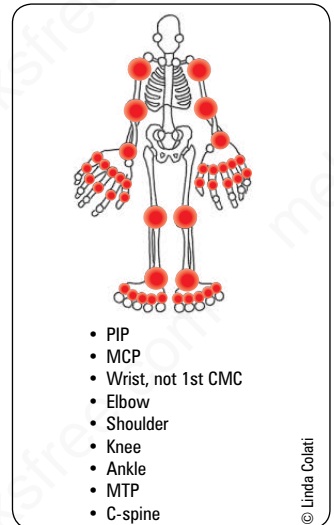

Figure 5. Common sites of joint involvement in RA

Table 13. Extra-Articular Features of RA Classified by Underlying Pathophysiology

System	Vasculitic	Lymphocytic Infiltrate
Skin	Periungual infarction, cutaneous ulcers, palpable purpura	Rheumatoid nodules (may have vasculitic component)
Ocular	Episcleritis, scleritis	Keratoconjunctivitis sicca
Head and Neck		Xerostomia, Hashimoto's thyroiditis (see Endocrinology, E27)
Cardiac		Peri-/myocarditis, valvular disease, conduction defects
Pulmonary		Pulmonary fibrosis, pleural effusion, pleuritis, pulmonary nodules
Neurologic	Peripheral neuropathy: sensory stocking-glove, mononeuritis multiplex	
Hematologic		Splenomegaly, neutropenia (Felty's syndrome)
Renal		Amyloidosis – caused by accumulation of abnormal proteins

Classification of Global Functional Status in RA

- **Class I:** able to perform usual ADLs (self-care, vocational, avocational)
- **Class II:** able to perform self-care and vocational activities, restriction of avocational activities
- **Class III:** able to perform self-care, restriction of vocational and avocational activities
- **Class IV:** limited ability to perform self-care, vocational, and avocational activities

Figure 6. Joint deformities

Syndromes in RA

- SS (common): keratoconjunctivitis sicca and xerostomia (dry eyes and mouth)
- Caplan's syndrome (very rare): combination of RA + Pneumoconiosis that manifests as multiple intrapulmonary nodules
- Felty's syndrome (rare): arthritis, splenomegaly, neutropenia

Investigations

- blood work
 - RF: 80% sensitivity but non-specific; may not be present at onset of symptoms; levels DO NOT correlate with disease activity
 - ♦ can be associated with more erosions, more extra-articular manifestations, and worse function
 - anti-CCP: 80% sensitivity but more specific (94-98%); may precede onset of symptoms
 - increased disease activity is associated with decreased Hb (anemia of chronic disease), increased platelets, ESR, CRP, and RF
- imaging
 - x-rays may be normal at onset
 - first change is periarticular osteopenia, followed by erosions
 - U/S (with power doppler), MRI may be used to image hands to detect early synovitis and erosions
 - ♦ MRI T1 inflamed synovium is hypointense and hyperintense on T1; bone marrow edema can be seen as well as areas of increased uptake gadolinium contrast

Treatment

- goals of therapy: remission or lowest possible disease activity
 - key is early diagnosis and early intervention with DMARDs
 - “window of opportunity” = early treatment within first 3 mo of disease may allow better control/remission
 - assess poor prognostic factors at baseline (RF positive, functional limitations and extra-articular features)
- behavioural
 - exercise program (isometrics and active, gentle ROM exercise during flares, aquatic/aerobic/strengthening exercise between flares), assistive devices as needed
 - job modification may be necessary
- pharmacologic: alter disease progression
 - only DMARDs and biologics (not analgesics or NSAIDs) can alter the course of RA
 - DMARDs
 - ♦ methotrexate (MTX) is the gold standard and is first-line unless contraindicated
 - chest X-ray should be assessed prior to MTX therapy
 - if inadequate response (3-6 mo) → combine or switch
 - consider including add-on medications to MTX if patients have poor prognostic features or high disease activity
 - add-ons include: hydroxychloroquine, sulfasalazine, leflunomide
 - biologics
 - ♦ should be combined with DMARD therapy (initiating with combination therapy is associated with faster response rates) or used if inadequate response to DMARDs
 - ♦ first-line (anti-TNF) options: infliximab, etanercept, adalimumab, golimumab and certolizumab
 - ♦ non anti-TNF agents include anakinra, abatacept, rituximab and tocilizumab
 - ♦ reassess every 3-6 mo and monitor disease severity
- pharmacologic: reduce inflammation and pain
 - NSAIDs
 - ♦ individualize according to efficacy and tolerability
 - ♦ contraindicated/cautioned in some patients (e.g. PUD, ischemic cardiac disease, pregnancy)
 - ♦ add acetaminophen ± opioid prn for synergistic pain control
 - corticosteroids
 - ♦ local: injections to control symptoms in a specific joint
 - ♦ systemic (prednisone)
 - low dose (5-10 mg/d) useful for short-term to improve symptoms if NSAIDs are ineffective to bridge gap until DMARDs take effect
 - severe RA: add low dose prednisone to DMARDs
 - do baseline DEXA bone density scan and consider bone supportive pharmacologic therapy if using corticosteroids >3 mo at 7.5 mg/d
 - cautions/contraindications: active infection, TB, osteoporosis, HTN, gastric ulcer, DM
- surgical
 - indicated for structural joint damage
 - surgical options include: synovectomy, joint replacement, joint fusion, reconstruction/tendon repair

Follow-Up Management and Clinical Outcomes

- follow-up every 3-6 mo, then 6-12 mo after inflammation has been suppressed
- examine joints for active inflammation – if active, consider adjusting medications, PT/OT
- if assessment reveals joint damage – consider analgesia, referral to PT/OT, surgical options
- outcome depends on disease activity, joint damage, physical functional status, psychological health, and comorbidities
- functional capacity is a useful tool for determining therapeutic effectiveness; many tools for evaluation have been validated
- patients with RA have an increased prevalence of other serious illnesses: infection (e.g. pulmonary, skin, joint), renal impairment, lymphoproliferative disorders, cardiovascular disease (correlates with disease activity and duration)
- increased risk of premature mortality, decreased life expectancy (most mortality not directly caused by RA)

Poor prognostic features of RA include: young age of onset, high RF titer, elevated ESR, activity of >20 joints, and presence of extra-articular features

Side Effects of Steroids

- Weight gain
- Osteoporosis
- AVN
- Cataracts, glaucoma
- PUD
- Susceptibility to infection
- Easy bruising
- Acne
- HTN
- Hyperlipidemia
- Hypokalemia, hyperglycemia
- Mood swings

DMARDs, prednisone and biologics alter the course of RA but not analgesics or NSAIDs

CRA Guidelines for Pharmacological Management of RA with Traditional and Biologic DMARDs

J Rheumatol 2011;39:1559-1582

CRA Recommendations of RA Pharmacologic Management

1. General Management: Remission is the goal of management and if not possible, minimal disease activity and quality of life improvement are desired. Poor prognostic factors should be assessed at baseline (RF, functional limitation, extra-articular features). Active RA patients should be monitored every 1-3 mo. A change in management should be considered where erosions are seen on x-ray despite clinical response.
2. Glucocorticoids: Should be used at the lowest possible dose and tapered as soon as possible. Can be added to initial DMARD therapy or used for managing flares, or symptom control if all other options have been exhausted.
3. Treatment with MTX or DMARD: MTX is the preferred DMARD and should be used unless contraindicated. DMARDs should be used rapidly in patients with persistent synovitis. CBC, LFT, renal function, and CXR should be assessed prior to MTX therapy. MTX requires individualized dosing. In patients with poor prognostic features or high disease activity, DMARD combinations where MTX is the anchor medication should be considered. Biologics are indicated for therapy in patients who continue to have moderate-high disease activity despite being treated with at least two DMARDs in therapeutic doses for 3 mo. Anti-TNFs are the first line recommended treatment after DMARDs. Addition of MTX to biologics improves efficacy.

Systemic Lupus Erythematosus

- see [Nephrology, NP24](#)

Definition

- chronic inflammatory multi-system disease of unknown etiology
- characterized by production of autoantibodies and diverse clinical manifestations

Table 14. Diagnostic Criteria of SLE*

Criteria	Description
CLINICAL	
Malar rash	Classic "butterfly rash", sparing of nasolabial folds, no scarring
Discoid rash	May cause scarring due to invasion of basement membrane
Photosensitivity	Skin rash in reaction to sunlight
Oral/nasal ulcers	Usually painless
Arthritis	Symmetric, involving ≥ 2 small or large peripheral joints, non-erosive
Serositis	Pleuritis or pericarditis
Neurologic disorder	Seizures or psychosis
LABORATORY	
Renal disorder	Proteinuria (>0.5 g/d or 3+) Cellular casts (RBC, Hb, granular, tubular, mixed)
Hematologic disorder	Hemolytic anemia, leukopenia, lymphopenia, thrombocytopenia
Immunologic disorder	Anti-dsDNA or anti-Sm or antiphospholipid Ab (anticardiolipin Ab, SLE anticoagulant) or false positive VDRL with 6 mo confirmatory negative
ANA	Most sensitive test (98%), not specific

*Note: "4, 7, 11" rule \rightarrow 4 (or more) out of 11 criteria (4 lab, 7 clinical) must be present, serially or simultaneously, for diagnosis
American College of Rheumatology, 1997 update

Etiology and Pathophysiology

- production of cytotoxic autoantibodies and immune complex formation
- multi-factorial etiology
- **genetics**
 - common association with HLA-B8/DR3; $\sim 10\%$ have positive family history
 - strong association with defects in apoptotic clearance \rightarrow fragments of nuclear particles captured by antigen-presenting cells \rightarrow develop anti-nuclear antibodies
 - cytokines involved in inflammatory process and tissue injury: B-lymphocyte stimulator (BlyS), IL-6, IL-17, IL-18, TNF- α
- **environment**
 - UV radiation, cigarette smoking, infection, vitamin D deficiency
- **estrogen**
 - increased incidence after puberty, decreased incidence after menopause
 - men with SLE have higher concentration of estrogenic metabolites
- **infection**
 - viral (non-specific stimulant of immune response)
- **drug-induced**
 - anti-hypertensives (hydralazine), anti-convulsants (phenytoin), anti-arrhythmics (procainamide), isoniazid, biologics, oral contraceptive pills
 - anti-histone Abs are commonly seen in drug-induced SLE
 - symptoms resolve with discontinuation of offending drug

Epidemiology

- prevalence: 0.05% overall
- F:M = 10:1
- age of onset in reproductive yr (13-40)
- more common and severe in African-Americans and Asians
- bimodal mortality pattern
 - early (within 2 yr)
 - ♦ active SLE, active nephritis, infection secondary to steroid use
 - late (>10 yr)
 - ♦ inactive SLE, inactive nephritis, atherosclerosis likely due to chronic inflammation

Signs and Symptoms

- characterized by periods of exacerbation and remission

Diagnostic Criteria of SLE

MD SOAP BRAIN

Malar rash	Blood
Discoid rash	Renal
Serositis	Arthritis
Oral ulcers	Immune
ANA	Neurologic
Photosensitivity	

Figure 7. Multi-factorial etiology of SLE

Drug-Induced SLE

Often presents atypically with systemic features and serositis; usually associated with anti-histone Ab

Table 15. Signs and Symptoms of SLE

System	Symptoms
Systemic	Fatigue, malaise, weight loss, fever, lymphadenopathy
Renal	HTN, peripheral edema, glomerulonephritis, renal failure
Dermatologic	Photosensitivity, malar rash, discoid rash, oral ulcers, alopecia (hair loss), purpura, panniculitis (inflammation of subcutaneous fat and muscle tissue), urticaria
Musculoskeletal	Polyarthralgias, polyarthritis, myalgias, AVN; reducible deformities of hand = Jaccoud's arthritis
Ophthalmic	Keratoconjunctivitis sicca, episcleritis, scleritis, cytooid bodies (cotton wool exudates on fundoscopy = infarction of nerve cell layer of retina)
Cardiac	Pericarditis, CAD, non-bacterial endocarditis (Libman-Sachs), myocarditis Note: SLE is an independent risk factor for atherosclerosis and CAD
Vascular	Raynaud's phenomenon, livedo reticularis (mottled discolouration of skin due to narrowing of blood vessels, characteristic lacy or net-like appearance), thrombosis, vasculitis
Respiratory	Pleuritis, ILD, pulmonary HTN, PE, alveolar hemorrhage
Gastrointestinal	Pancreatitis, SLE enteropathy, hepatitis, hepatomegaly, splenomegaly
Neurologic/Psychiatric	H/A, depression, psychosis, seizures, cerebritis, transverse myelitis, peripheral neuropathy, stroke
Life/Organ-Threatening	Cardiac: coronary vasculitis, malignant HTN, tamponade Hematologic: hemolytic anemia, neutropenia, thrombocytopenia, TTP, thrombosis Neurologic: seizures, CVA, stroke Respiratory: pulmonary hypertension, pulmonary hemorrhage, emboli

Investigations

- ANA (98% sensitivity, but poor specificity → used as a screening test; ANA titres are not useful to follow disease course)
- anti-dsDNA and anti-Sm are specific (95-99%)
- anti-dsDNA titre and serum complement (C3, C4) are useful to monitor treatment response in patients who are clinically and serologically concordant (anti-dsDNA, C3, and C4 also fluctuate with disease activity)
- antiphospholipid Ab (anti-cardiolipin Ab, SLE anticoagulant, Anti-β₂ glycoprotein-I Ab), may cause increased risk of clotting and increased aPTT

Treatment

- goals of therapy**
 - treat early and avoid long-term steroid use, if unavoidable see [Endocrinology, E40](#) for osteoporosis management
 - if high doses of steroids necessary for long-term control, add steroid-sparing agents and taper when possible
 - treatment is tailored to organ system involved and severity of disease
 - all medications used to treat SLE require periodic monitoring for potential toxicity
- dermatologic**
 - sunscreen, avoid UV light and estrogens
 - topical steroids, hydroxychloroquine
- musculoskeletal**
 - NSAIDs ± gastroprotective agent for arthritis (also beneficial for pleuritis and pericarditis)
 - hydroxychloroquine improves long-term control and prevents flares
 - bisphosphonates, calcium, vitamin D to combat osteoporosis
- organ-threatening disease**
 - high-dose oral prednisone or IV methylprednisolone in severe disease
 - steroid-sparing agents: azathioprine, MTX, mycophenolate mofetil
 - IV cyclophosphamide for serious organ involvement (e.g. cerebritis or lupus nephritis) see [Nephrology, Systemic Lupus Erythematosus, NP24](#) for clinical features of lupus nephritis

Raynaud's Phenomenon

Vasospastic disorder characteristically causing discolouration of fingers and toes (white → blue → red)
Classic triggers: cold and emotional stress

Consider SLE in a patient who has involvement of 2 or more organ systems

The arthritis of SLE can be deforming but it is non-erosive (in contrast to RA)

Antiphospholipid Antibody Syndrome

Definition

- multi-system vasculopathy manifested by recurrent thromboembolic events, spontaneous abortions, and thrombocytopenia
- often presents with migraine-type H/As
- circulating antiphospholipid autoantibodies interfere with coagulation
- primary APLS:** occurs in the absence of other disease
- secondary APLS:** occurs in the setting of a connective tissue disease (including SLE), malignancy, drugs (hydralazine, procainamide, phenytoin, interferon, quinidine), and infections (HIV, TB, hepatitis C, infectious mononucleosis)
- catastrophic APLS:** development within 1 wk of small vessel thrombotic occlusion in ≥3 organ systems with positive antiphospholipid Ab (high mortality)

Table 16. Classification Criteria of APLS*

Criteria	Description
CLINICAL	
Vascular thrombosis	Arterial: stroke/TIA, multi-infarct dementia, MI, valvular incompetence, limb ischemia Venous: DVT, PE, renal and retinal vein thrombosis Must be confirmed by imaging or histopathology
Pregnancy morbidity	Fetal death (>10 wk GA), recurrent spontaneous abortions (<10 wk GA) or premature birth (<34 wk GA)
LABORATORY	
Labs must be positive on 2 occasions, at least 12 wk apart	
SLE anticoagulant	Prolonged aPTT not corrected by the addition of normal plasma
Anti-cardiolipin Ab	IgG and/or IgM
Anti-β2 glycoprotein-I Ab	IgG and/or IgM
ANA	Most sensitive test (98%), not specific

* 1 clinical and 1 laboratory criteria must be present

J Thromb Haemost 2006;4:295-306**Signs and Symptoms**

- see clinical criteria in **Table 16**
- hematologic
 - thrombocytopenia, hemolytic anemia, neutropenia
- dermatologic
 - livedo reticularis, Raynaud's phenomenon, purpura, leg ulcers, and gangrene

Treatment

- thrombosis
 - lifelong anti-coagulation with warfarin
 - target INR 2.0-3.0 for first venous event, >3.0 for recurrent and/or arterial event
- recurrent fetal loss
 - heparin/low molecular weight heparin ± ASA during pregnancy
- catastrophic APLA
 - high-dose steroids, anti-coagulation, cyclophosphamide, plasmapheresis

**Manifestations of APLA**

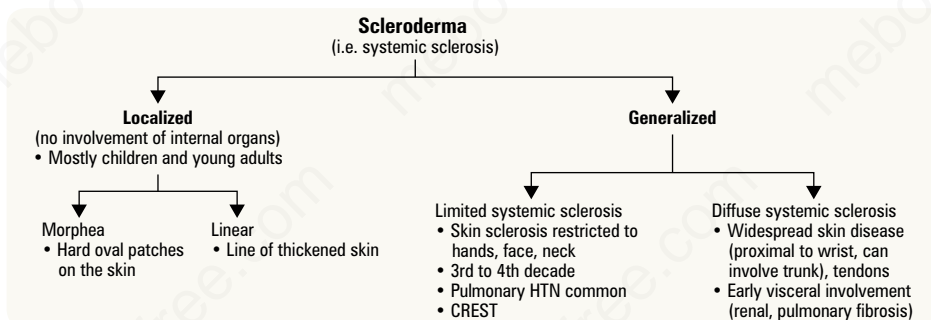

- Thromboembolic events
- Spontaneous abortions
- Thrombocytopenia
- Associated with livedo reticularis, migraine headaches

Arterial and venous thrombosis are usually mutually exclusive

Scleroderma (i.e. Systemic Sclerosis)**Definition**

- a non-inflammatory autoimmune disorder characterized by widespread small vessel vasculopathy, production of autoantibodies, and fibroblast dysfunction causing fibrosis

**Figure 8. Forms of scleroderma****Table 17. The American College of Rheumatology (ACR)/European League Against Rheumatism (EULAR) Criteria for Scleroderma***

Item	Sub-item	Score
1. Skin thickening of fingers of both hands extending proximal to the MCP (sufficient criterion)		9
2. Skin thickening of the fingers	Puffy fingers	2
	Sclerodactyly	4
3. Fingertip lesions	Digital tip ulcers	2
	Fingertip pitting scars	3
4. Telangiectasia		2
5. Abnormal nailfold capillaries		2
6. Pulmonary arterial HTN ± ILD (max score 2)	Pulmonary arterial HTN	2
	ILD	2
7. Raynaud's phenomenon		3
8. Scleroderma related Ab	Anti-centromere	3
	Anti-topoisomerase I	
	Anti-RNA polymerase III	

* Score of ≥9 is sufficient to classify a patient as having definite scleroderma (sensitivity 0.95, specificity 0.93) *Arthritis & Rheum* 2013;65(11):2737-2747**CREST Syndrome**

- Calcinosis
- Raynaud's phenomenon
- Esophageal dysmotility
- Sclerodactyly
- Telangiectasia

Scleroderma is the most common cause of secondary Raynaud's phenomenon

Etiology and Pathophysiology

- idiopathic vasculopathy (not vasculitis) leading to atrophy and fibrosis of tissues
 - intimal proliferation and media mucinous degeneration → progressive obliteration of vessel lumen → fibrotic tissue
 - resembles malignant HTN
 - lung disease is the most common cause of morbidity and mortality

Epidemiology

- F:M = 3-4:1, peaking in 5th and 6th decades
- associated with HLA-DR1
- associated with environmental exposure (silica, epoxy resins, toxic oil, aromatic hydrocarbons, polyvinyl chloride)
- limited systemic sclerosis has a higher survival prognosis (>70% at 10 yr) than diffuse systemic sclerosis (40-60% at 10 yr)

Signs and Symptoms

Table 18. Clinical Manifestations of Scleroderma

System	Features
Dermatologic	Painless non-pitting edema → skin tightening Ulcerations, calcinosis, periungual erythema, hypo/hyperpigmentation, pruritus, telangiectasias Characteristic face: mask-like facies with tight lips, beak nose, radial perioral furrows
Vascular	Raynaud's phenomenon → digital pits, gangrene
Gastrointestinal (~90%)	Distal esophageal hypomotility → dysphagia Loss of lower esophageal sphincter function → GERD, ulcerations, strictures Small bowel hypomotility → bacterial overgrowth, diarrhea, bloating, cramps, malabsorption, weight loss Large bowel hypomotility → wide mouth diverticuli are pathognomonic radiographic finding on barium study
Renal	Mild proteinuria, Cr elevation, HTN "Scleroderma renal crisis" (10-15%) may lead to malignant arterial HTN, oliguria, and microangiopathic hemolytic anemia
Pulmonary	Interstitial fibrosis, pulmonary HTN, pleurisy, pleural effusions
Cardiac	Left ventricular dysfunction, pericarditis, pericardial effusion, arrhythmias
Musculoskeletal	Polyarthralgias "Resorption of distal tufts" (radiological finding) Proximal weakness 2° to disuse, atrophy, low grade myopathy
Endocrine	Hypothyroidism

Investigations

- blood work
 - CBC, Cr, ANA
 - anti-topoisomerase 1/anti-Scl-70: specific but not sensitive for diffuse systemic sclerosis
 - anti-centromere: favours diagnosis of CREST (limited systemic sclerosis)
- PFT
 - assess for interstitial lung disease
- imaging
 - CXR for fibrosis, echo for pulmonary HTN

Treatment

- dermatologic
 - good skin hygiene
 - low-dose prednisone (>20 mg may provoke renal crisis if susceptible), MTX (limited evidence)
- vascular
 - patient education on cold avoidance
 - vasodilators (CCBs, local nitroglycerine cream, systemic PGE2 inhibitors, PDE5 inhibitors)
- gastrointestinal
 - GERD: PPIs are first line, then H2-receptor agonists
 - small bowel bacterial overgrowth: broad spectrum antibiotics (tetracycline, metronidazole)
- renal disease
 - ACEI for hypertensive crisis
 - see [Nephrology, NP32](#) for scleroderma renal crisis
- pulmonary
 - early interstitial disease: cyclophosphamide
 - pulmonary HTN: vasodilators (e.g. bosentan, epoprostenol, and PDE5 inhibitors)
- cardiac
 - pericarditis: systemic steroids
- musculoskeletal
 - arthritis: NSAIDs
 - myositis: systemic steroids

Cyclophosphamide versus Placebo in Scleroderma Lung Disease

NEJM 2006; 354:2655-66

Study: Double-blind, randomized, placebo-controlled trial

Outcome: Lung function and health-related symptoms

Results: The mean absolute difference in adjusted 12-month FVC percent predicted between cyclophosphamide and placebo groups was 2.53 percent, favouring cyclophosphamide. There were also treatment-related differences in physiological and symptom outcomes, and the difference in FVC was maintained at 24 months

Conclusion: Cyclophosphamide has a significant but modest beneficial effect on lung function, dyspnea, thickening of skin and health-related quality of life in patients with symptomatic, scleroderma-related interstitial lung disease

Raynaud's Phenomenon DDx

COLD HAND

Cryoglobulins/Cryofibrinogens

Obstruction/Occupational

Lupus erythematosus, other connective tissue disease

Diabetes mellitus/Drugs

Hematologic problems (polycythemia, leukemia, etc.)

Arterial problems (atherosclerosis)/Anorexia nervosa

Neurologic problems (vascular tone)

Disease of unknown origin (idiopathic)

Features of Pathologic Raynaud's Syndrome

- New onset
- Asymmetric
- Precipitated by stimuli other than cold or emotion
- Associated with distal pulp pitting or tissue reabsorption
- Digit ischemia
- Capillary dilatation by capillaroscopy

Idiopathic Inflammatory Myopathy

Definition

- autoimmune diseases characterized by proximal muscle weakness ± pain
- muscle becomes damaged by a non-suppurative lymphocytic inflammatory process
- associated with malignancy
 - increased risk of malignancy: age >50, DMM>PM, normal CK, refractory disease
- associated with other connective tissue disease, Raynaud's phenomenon, autoimmune disorders

Classification

- PM/DMM
- adult and juvenile form

Inclusion Body Myositis

- age >50, M>F, slowly progressive, vacuoles in cells on biopsy
- suspect when patient unresponsive to treatment
- distal as well as proximal muscle weakness
- muscle biopsy positive for inclusion bodies

POLYMYOSITIS/DERMATOMYOSITIS

Table 19. Classification Criteria for PM/DMM*

Criteria	Description
1. Symmetric proximal muscle weakness	Typical involvement of shoulder girdle and hip girdle
2. Elevated muscle enzymes	↑ CK, aldolase, LDH, AST, ALT
3. EMG changes	Short polyphasic motor units, high frequency repetitive discharge, insertional irritability
4. Muscle biopsy	Segmental fibre necrosis, basophilic regeneration, perivascular inflammation (DMM), endomysial inflammation (PM) and atrophy
5. Typical rash of dermatomyositis	Required for diagnosis of DMM (see below)

*Definite if 4 present, probable if 3 present *NEJM* 1975;292:403-407

Etiology and Pathophysiology

- PM is CD8 cell-mediated muscle necrosis, found in adults
- DMM is B-cell and CD4 immune complex-mediated, and causes peri-fascicular vascular abnormalities

Signs and Symptoms

- progressive symmetrical proximal muscle weakness (shoulder and hip) developing over weeks to months
 - difficulty lifting head off pillow, arising from chair, climbing stairs
- dermatological
 - DMM has characteristic dermatological features (F>M, children and adults)
 - ♦ Gottron's papules
 - pink-violaceous, flat-topped papules overlying the dorsal surface of the interphalangeal joints
 - ♦ Gottron's sign
 - erythematous, smooth or scaly patches over the dorsal IPs, MCPs, elbows, knees, or medial malleoli
 - ♦ heliotrope rash: violaceous rash over the eyelids; usually with edema
 - ♦ shawl sign: poikilodermatous erythematous rash over neck, upper chest, and shoulders
 - ♦ mechanic's hands: dark, dry, thick scale on palmar and lateral surface of digits
 - ♦ periungual erythema
- cardiac
 - arrhythmias, CHF, conduction defect, ventricular hypertrophy, pericarditis
- gastrointestinal
 - oropharyngeal and lower esophageal dysphagia, reflux
- pulmonary
 - weakness of respiratory muscles, ILD, aspiration pneumonia

Investigations

- blood work: CK, ANA, anti-Jo-1 (DMM), anti-Mi-2, anti-SRP
- imaging: MRI may be used to localize biopsy site
- EMG, muscle biopsy

Signs of DMM

Gottron's papules and Gottron's sign are pathognomonic of DMM (occur in 70% of patients)

Malignancies Associated with DMM

- Breast
- Lung
- Colon
- Ovarian

Treatment

- non-pharmacological treatment
 - physical therapy and occupational therapy
- pharmacological treatment
 - high-dose corticosteroid (1-2 mg/kg/d) and slow taper
 - add immunosuppressive agents (azathioprine, MTX, cyclosporine)
 - IVIg if severe or refractory
 - hydroxychloroquine for DMM rash
- malignancy surveillance
 - detailed history and physical (breast, pelvic, and rectal exam)
 - CXR, abdominal and pelvic U/S, fecal occult blood, Pap test, mammogram ± CT scan (thoracic, abdominal, pelvic)

Sjögren's Syndrome

Definition

- autoimmune condition characterized by dry eyes (keratoconjunctivitis sicca/xerophthalmia) and dry mouth (xerostomia), caused by lymphocytic infiltration of salivary and lacrimal glands
- may evolve into systemic disorder with diminished exocrine gland activity in respiratory tract and skin
- primary and secondary form (associated with RA, SLE, DMM, and HIV)
- prevalence, F>>M, 40-60 yo
- increased risk of non-Hodgkin's lymphoma

Table 20. American College of Rheumatology Classification for Sjögren's*

Criteria	Comments
1. Positive serum anti-SSA/Ro and/or anti-SSB/La or positive RF and ANA titer >1:320	
2. Labial salivary gland biopsy with focal lymphocytic sialadenitis with focus score ≥ 1 focus /4mm ²	Focus scores are histopathologic grading systems Strongly associated with phenotypic ocular and serological component's of Sjögren's
3. Keratoconjunctivitis sicca with ocular staining score >3	Ocular staining score based on fluorescein dye examination of conjunctiva and cornea to determine clinical changes

*Classification criteria is met in patients with signs/symptoms of Sjögren's, who have at least 2 of the above features

1. Arthritis Care & Research 2012;64(4):475-487; 2. Arthritis Rheum 2011;53(7):2021-2030; 3. Am J Ophthalmol 2010;149(3):405-441

Signs and Symptoms

- "sicca complex": dry eyes (keratoconjunctivitis sicca/xerophthalmia), dry mouth (xerostomia)
- staphylococcal blepharitis
- dental caries, oral candidiasis, angular cheilitis (inflammation and fissuring at the labial commissures of the mouth)
- systemic complications
 - sinusitis
 - autoimmune thyroid dysfunction
 - arthralgias, arthritis
 - subclinical diffuse ILD, xerotrachea leading to chronic dry cough
 - renal disease, glomerulonephritis
 - palpable purpura, vasculitis
 - peripheral neuropathy
 - lymphoma risk greatly increased

Treatment

- ocular
 - artificial tears or surgical punctal occlusion for dry eyes
- oral
 - good dental hygiene, hydration
 - parasympathomimetic agents that stimulate salivary flow (e.g. pilocarpine)
 - topical nystatin or clotrimazole x 4-6 wk for oral candidiasis
- systemic (e.g. hydroxychloroquine, corticosteroids)

Patients with Sjögren's syndrome are at higher risk of non-Hodgkin's lymphoma

Classic Triad (identifies 93% of Sjögren's patients)

- Dry eyes
- Dry mouth (xerostomia) → dysphagia
- Arthritis (small joint, asymmetrical, non-erosive) but may be associated with rheumatoid arthritis, in which case, the arthritis is erosive and symmetric

Mixed Connective Tissue Disease

- syndrome with features of 3 different connective tissue diseases (e.g. SLE, scleroderma, PM)
- common symptoms: Raynaud's phenomenon, swollen fingers
- blood work: anti-RNP (see Table 10)
- treatment is generally guided by the severity of symptoms and organ system involvement
- prognosis
 - 50-60% will evolve into SLE
 - 40% will evolve into scleroderma
 - only 10% will remain as MCTD for the rest of their lives
- cardiac involvement (arrhythmia) common, renal or lung involvement rare

Overlap Syndrome

- syndrome with sufficient diagnostic features of 2+ different connective tissue diseases

Vasculitides

- inflammation and subsequent necrosis of blood vessels leading to tissue ischemia or infarction of any organ system
- diagnosis
 - clinical suspicion: suspect in cases of unexplained multiple organ ischemia or systemic illness with no evidence of malignancy or infection; constitutional symptoms such as fever, weight loss, anorexia, fatigue
 - labs non-specific: anemia, increased WBC and ESR, abnormal U/A
 - investigations: biopsy if tissue accessible; angiography if tissue inaccessible
- treatment generally involves corticosteroids and/or immunosuppressive agents

Table 21. Classification of Vasculitis and Characteristic Features

Classification	Characteristic Features
SMALL VESSEL	
Non-ANCA-associated	Immune complex-mediated (most common mechanism)
Predominantly cutaneous vasculitis	Also known as hypersensitivity/leukocytoclastic vasculitis
IgA vasculitis (formerly Henoch-Schönlein purpura [HSP]) (see Pediatrics, P86)	Vascular deposition of IgA causing systemic vasculitis (skin, GI, renal), usually self-limiting; most common in childhood
Cryoglobulinemic vasculitis (CV)	Systemic vasculitis caused by circulating cryoproteins forming immune complexes; 60-80% of cases are due to Hepatitis C, 5-10% are due to a CTD (SLE, RA, SS), 5-10% are due to a lymphoproliferative disorder and the remaining 5-10% are idiopathic or "essential". CV may be associated with underlying infection (e.g. hepatitis C) or connective tissue disease
ANCA-associated (i.e. PR3-ANCA) Granulomatosis with polyangiitis (GPA, formerly Wegener's) pR3 (c-ANCA) > MPO (p-ANCA)	Granulomatous inflammation of vessels of respiratory tract and kidneys; initially have URTI symptoms; most common in middle age
Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) (50% ANCA positive)	Granulomatous inflammation of vessels with hypereosinophilia and eosinophilic tissue infiltration, frequent lung involvement (asthma, allergic rhinitis), associated with MPO-ANCA in 40-50% of cases. Other manifestations include peripheral neuropathy (70%), GI involvement, myocarditis and rarely coronary arteritis; average age 40s
Microangiopathic polyangiitis (70% ANCA positive, usually MPO)	Pauci-immune necrotizing vasculitis, affecting kidneys (necrotizing glomerulonephritis), lungs (capillaritis and alveolar hemorrhage), skin,; most common in middle age
MEDIUM VESSEL	
Polyarteritis nodosa	Segmental, non-granulomatous necrotizing inflammation Unknown etiology in most cases, any age (average 40-50s), M>F
Kawasaki disease (see Pediatrics, P87)	Arteritis and mucocutaneous lymph node syndrome
LARGE VESSEL	
GCA/Temporal arteritis	Inflammation predominantly of the aorta and its branches >50 yr of age, F>M
Takayasu's arteritis	"Pulseless disease", unequal peripheral pulses, chronic inflammation, most often the aorta and its branches Usually young adults of Asian descent, F>M, risk of aortic aneurysm
OTHER VASCULITIDES	
Buerger's disease ("Thromboangiitis Obliterans")	Inflammation and clotting of small and medium-sized arteries and veins of distal extremities, may lead to distal claudication and gangrene, most important etiologic factor is cigarette smoking. Most common in young Asian males
Behçet's disease	Multi-system disorder presenting with ocular involvement (uveitis), recurrent oral and genital ulceration, venous thrombosis, skin and joint involvement; more common in Mediterranean and Asian, average age 30 yr old, M>F
Vasculitis mimicry (i.e. pseudovasculitis)	Cholesterol emboli, atrial myxoma, bacterial endocarditis (SBE), APLS

Features of Small Vessel Vasculitis

- Palpable purpura
- Vesicles
- Chronic urticaria
- Superficial ulcers (erosions)

c-ANCA (i.e. pR3-ANCA): cytoplasmic anti-neutrophil cytoplasmic Ab associated with anti-pR3
p-ANCA (i.e. MPO-ANCA): perinuclear anti-neutrophil cytoplasmic Ab associated with multiple antigens, e.g. myeloperoxidase, lactoferrin (LBD), cathepsin, elastase etc. Of these only antibodies to myeloperoxidase have been associated with the development of vasculitis

Features of Medium Vessel Vasculitis

- Livedo reticularis
- Erythema nodosum
- Raynaud's phenomenon
- Nodules
- Digital infarcts
- Ulcers

Churg-Strauss Triad

- Allergic rhinitis and asthma (often quiescent at time of vasculitis)
- Eosinophilic infiltrative disease resembling pneumonia
- Systemic vasculitis often mononeuritis multiplex/peripheral neuropathy and peripheral eosinophilia

Figure 9. Classification of vasculitides by vessel size

Small Vessel Non-ANCA Associated Vasculitis

CUTANEOUS VASCULITIS

- subdivided into
 - drug-induced vasculitis
 - serum sickness reaction
 - vasculitis associated with other underlying primary diseases (CTD, infections, malignancies – hematologic > solid tumours)

Etiology and Pathophysiology

- cutaneous vasculitis following:
 - drug exposure (allopurinol, gold, sulfonamides, penicillin, phenytoin)
 - viral or bacterial infection
 - idiopathic causes
- small vessels involved (post-capillary venules most frequently)
- usually causes a leukocytoclastic vasculitis: debris from neutrophils around vessels
- sometimes due to cryoglobulins which precipitate in cold temperatures

Signs and Symptoms

- palpable purpura ± vesicles and ulceration, urticaria, macules, papules, bullae, subcutaneous nodules
 - renal or joint involvement may occur, especially in children

Investigations

- vascular involvement (both arteriole and venule) established by skin biopsy

Treatment

- stop possible offending drug
- NSAID, low dose corticosteroids
 - immunosuppressive agents in resistant cases
- usually self-limiting

Small Vessel ANCA-Associated Vasculitis

GRANULOMATOSIS WITH POLYANGIITIS (GPA, formerly known as Wegener's Granulomatosis)

Definition

- granulomatous inflammation of vessels that may affect the upper airways (rhinitis, sinusitis), lungs (pulmonary nodules, infiltrates), and kidneys (glomerulonephritis, renal failure)
- highly associated with c-ANCA by indirect immunofluorescence (IIF) and pR3-ANCA by ELISA; however, changes in ANCA levels do not predict remission or relapse
- incidence 2-3 per 100,000; more common in Northern latitudes

Table 22. Classification Criteria for GPA*

Criteria	Description
1. Nasal or oral involvement	Inflammation, ulcers, epistaxis
2. Abnormal findings on CXR	Nodules, cavitations, etc.
3. Urinary sediment	Microscopic hematuria ± RBC casts
4. Biopsy of involved tissue	Lungs show granulomas, kidneys show necrotizing segmental glomerulonephritis

*Diagnosed if 2 or more of the above 4 criteria present

American College of Rheumatology, 1990

Classic Features of GPA

- Necrotizing granulomatous vasculitis of lower and upper respiratory tract
- Focal segmental glomerulonephritis

Etiology

- pathogenesis depends on genetic susceptibility and environmental triggers (e.g. infection)
 - dysregulated immune response due to loss of B and T-cell tolerance
 - acute vascular injury mediated by neutrophils and monocytes

Signs and Symptoms

- systemic
 - malaise, fever, weakness, weight loss
- HEENT
 - sinusitis or rhinitis, nasal crusting and bloody nasal discharge, nasoseptal perforation, saddle nose deformity
 - proptosis due to: inflammation/vasculitis involving extra-ocular muscles, granulomatous retrobulbar space occupying lesions or direct extension of masses from the upper respiratory tract
 - hearing loss due to involvement of CN VIII
- pulmonary
 - cough, hemoptysis, granulomatous upper respiratory tract masses
- renal
 - hematuria, proteinuria, elevated creatinine
- other
 - joint, skin, eye complaints, vasculitic neuropathy

Investigations

- blood work: anemia (normal MCV), increased WBC, increased Cr, increased ESR, elevated platelet count, ANCA (PR3 > MPO)
- urinalysis: proteinuria, hematuria, RBC casts
- CXR: pneumonitis, lung nodules, infiltrations, cavitary lesions
- biopsy: renal (segmental necrotizing glomerulonephritis), lung (granulomas, tracheobronchial erosion)
- c-ANCA and ESR often correlate with disease activity and used to monitor response to treatment in some patients

Treatment

- for severe, life or organ threatening disease
 - pulse methylprednisolone x 3 days followed by prednisone 1 mg/kg/d PO + cyclophosphamide 2 mg/kg/d PO for 36 mo OR rituximab 375 mg/m² followed by high dose MTX (20-25 mg PO/SC weekly) or azathioprine (2 mg/kg/d PO OD)
- consider plasmapheresis in patients with rapidly deteriorating renal failure or pulmonary hemorrhage

Efficacy of Remission Induction Regimens for ANCA-Associated Vasculitides (RAVE) Trial *NEJM* 2013; 369:417-427

Study: Multicentre, randomized, double-blind, double-dummy, non-inferiority trial.

Intervention: Rituximab

Outcome: Complete remission of disease by 6 months, with remission maintained through 18 months.

Results: 64% of the patients in the rituximab group, as compared with 53% of the patients in the cyclophosphamide-azathioprine group, had a complete remission by 6 months. At 12 and 18 months, 48% and 39%, respectively, of the patients in the rituximab group had maintained the complete remissions, as compared with 39% and 33%, respectively, in the comparison group. Rituximab met the prespecified criteria for noninferiority. There was no significant difference between the groups in any efficacy measure, including the duration of complete remission and the frequency or severity of relapses. Among the 101 patients who had relapsing disease at baseline, rituximab was superior to conventional immunosuppression at 6 months ($P=0.01$) and at 12 months ($P=0.009$) but not at 18 months.

Conclusion: In patients with severe ANCA-associated vasculitis, a single course of rituximab was as effective as continuous conventional immunosuppressive therapy for the induction and maintenance of remission over the course of 18 months.

Medium Vessel Vasculitis

POLYARTERITIS NODOSA

Definition

- systemic, necrotizing vasculitis of medium sized vessels
- ANCA negative
- 5-10% associated with hepatitis B positivity
- incidence 0.7 per 100,000; affects individuals between 40-60 yr; M:F = 2:1

Table 23. Classification Criteria for PAN*

Criteria	Description
1. Weight loss	>4 kg, not due to dieting or other factors
2. Myalgias, weakness, or leg tenderness	Diffuse myalgias or weakness
3. Livedo reticularis	Mottled, reticular pattern over skin
4. Neuropathy	Mononeuropathy, mononeuropathy multiplex, or polyneuropathy
5. Testicular pain or tenderness	Not due to infection, trauma, or other causes
6. dBP >90 mmHg	Development of HTN with dBP >90 mmHg
7. Elevated Cr or BUN	Cr >130 μ mol/L (1.5 mg/dL), BUN >14.3 mmol/L (40 mg/dL)
8. Hepatitis B positive	Presence of hepatitis B surface antigen or Ab
9. Arteriographic abnormality	Commonly aneurysms
10. Biopsy of artery	Presence of granulocytes and/or mononuclear leukocytes in the artery wall

*Diagnosed if 3 or more of the above 10 criteria present

American College of Rheumatology, 1990

Etiology and Pathophysiology

- focal panmural necrotizing inflammatory lesions in small and medium-sized arteries
- thrombosis, aneurysm, or dilatation at lesion site may occur
- healed lesions show proliferation of fibrous tissue and endothelial cells that may lead to luminal occlusion

Investigations

- blood work: CBC, ESR, Cr, BUN, p-ANCA, hepatitis B serology
- imaging: angiography
- arterial biopsy

Treatment

- prednisone 1 mg/kg/d PO and cyclophosphamide 2 mg/kg/d PO
- ± anti-viral therapy to enhance clearance of hepatitis B virus

Large Vessel Vasculitis**GCA/TEMPORAL ARTERITIS****Table 24. Classification Criteria for GCA***

Criteria	Description
1. Age at onset ≥50	
2. New H/A	Often temporal
3. Temporal artery abnormality	Temporal artery tenderness or decreased pulsations, not due to arteriosclerosis
4. Elevated ESR	ESR ≥50 mm/h
5. Abnormal artery biopsy	Mononuclear cell infiltration or granulomatous inflammation, usually with multinucleated giant cells

*Diagnosed if 3 or more of the above 5 criteria present

American College of Rheumatology, 1990**GCA Criteria**

Presence of 3 or more criteria yields sensitivity of 94%, specificity of 91%

Epidemiology

- most frequent vasculitis in North America
- patients >50 yr
- F:M = 2:1
- North-South gradient (predominance in Northern Europe/US)
- affects extracranial arteries

Signs and Symptoms

- new onset temporal H/A ± scalp tenderness due to inflammation of involved portion of the temporal or occipital arteries
- sudden, painless loss of vision and/or diplopia due to narrowing of the ophthalmic or posterior ciliary arteries (PCA more common); can affect both eyes
- tongue and jaw claudication (pain in muscles of mastication on prolonged chewing)
- PMR (proximal myalgia, constitutional symptoms, elevated ESR) occurs in 30% of patients
- aortic arch syndrome (involvement of subclavian and brachial branches of aorta resulting in pulseless disease), aortic aneurysm ± rupture are late complications
- constitutional symptoms and shoulder/pelvic girdle pain and stiffness

**Medical Emergency**If untreated, GCA can lead to permanent blindness in 20-25% of patients
Treat on clinical suspicion**Investigations**

- diagnosis made by clinical suspicion, increased ESR, increased CRP, temporal artery biopsy, and possibly U/S or MRI

Treatment

- if suspect GCA, immediately start high dose prednisone 1 mg/kg in divided doses for approximately 4 wk, and then tapering prednisone as symptoms resolve; highly effective in treatment and in prevention of blindness and other vascular complications
- consider low dose ASA to help decrease visual loss

Prognosis

- increased risk of thoracic aortic aneurysm and aortic dissection
- yearly CXR ± abdominal U/S as screening

Seronegative Rheumatic Disease

Table 25. A Comparison of the Spondyloarthropathies*

Feature	Ankylosing Spondylitis (AS)	Psoriatic Arthritis (PsA)	Reactive Arthritis (ReA)	Enteropathic Arthritis (EA)
M:F	3:1	1:1	8:1	1:1
Age of Onset	20s	35-45	20s	Any
Peripheral Arthritis	25%	96%	90%	Common
Distribution	Axial, LE	Any	LE	LE
Sacroiliitis	100%	40%	80%	20%
Dactylitis	Uncommon	Common	Occasional	Uncommon
Enthesitis	Common	Common	Common	Less Common
Skin Lesions	Rare	100% Psoriasis eventually 70% at onset of arthritis	Occasional Keratoderma blennorrhagica	Occasional Pyoderma, erythema nodosum
Uveitis	Common	Occasional	20%	Rare
Urethritis	Rare	Uncommon	Common	Rare
HLA-B27	90-95%	40%	80%	30%

LE = lower extremities *Spondyloarthropathy: inflammatory joint disease of the vertebral column

Ankylosing Spondylitis

Definition

- chronic inflammatory arthritis involving the sacroiliac joints and vertebrae
- enthesitis is a major feature
- prototypical spondyloarthropathy

Table 26. ASAS Classification Criteria for Axial Spondyloarthritis*

Sacroiliitis on Imaging plus ≥ 1 AS Feature or HLA-B27 Positive plus ≥ 2 AS Features	
AS Features	Sacroiliitis on Imaging
HLA-B27 positive	Active (acute) inflammation on MRI highly suggestive of sacroiliitis associated with AS
Inflammatory back pain	Definite radiographic sacroiliitis \geq grade 2 bilaterally or grade 3-4 unilaterally
Arthritis	
Enthesitis (heel)	
Uveitis	
Dactylitis	
Psoriasis	
Crohn's disease/colitis	
Good response to NSAIDs	
Family history of AS	
Elevated CRP	

*For patients with ≥ 3 mo back pain and age at onset < 45 yr

Etiology and Pathophysiology

- inflammation \rightarrow osteopenia \rightarrow erosion \rightarrow ossification \rightarrow osteoproliferation (syndesmophytes)

Epidemiology

- M:F = 3:1; females have milder disease which may be under-recognized and more peripheral arthritis and upper spine spondylitis
- 90-95% of patients have HLA-B27 (9% HLA-B27 positive in general population)

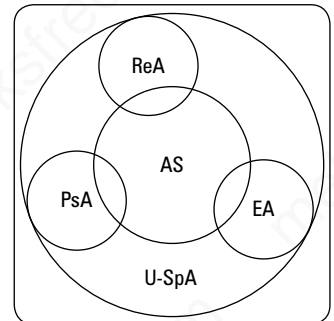

Figure 10. Spondyloarthropathy subsets

AS shares some features with the other three types of seronegative spondyloarthropathies such as ReA, EA, PsA and undifferentiated spondyloarthropathy (U-PSA)

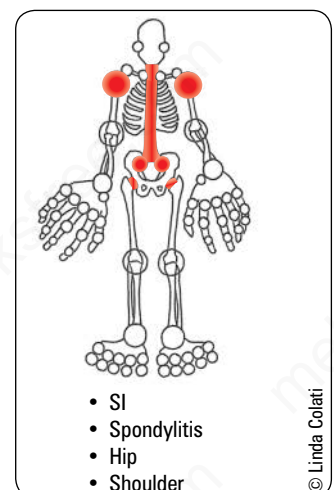

Enthesitis: inflammation of tendon or ligament at site of attachment to bone

Consider AS in the differential for causes of aortic regurgitation

Rule of 2s
AS occurs in
0.2% of the general population
2% of HLA-B27 positive individuals
20% of HLA-B27 positive individuals with affected family member

- SI
- Spondylitis
- Hip
- Shoulder

© Linda Colati

Figure 11. Common sites of involvement of AS

The Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) is a self-reported scoring system that focuses on fatigue, axial pain, peripheral pain, enthesitis, and morning stiffness

Table 27. Types of Back Pain

Parameter	Mechanical	Inflammatory
Past History	±	++
Family History	-	+
Onset	Acute	Insidious
Age	15-90 yr	<45 yr
Sleep Disturbance	±	++ (worse during 2nd half of night)
Morning Stiffness	<30 min	>1 h
Involvement of Other Systems	-	+
Exercise	Worse	Better
Rest	Better	Worse
Radiation of Pain	Anatomic (L5-S1)	Diffuse (thoracic, buttock)
Sensory Symptoms	+	-
Motor Symptoms	+	-

Signs and Symptoms

• axial

- mid and lower back stiffness, morning stiffness >1 h, night pain, persistent buttock pain, painful sacroiliac joint (+ FABER test)
- spinal restriction (decreased ROM): lumbar (decreased Schöber), thoracic (decreased chest wall expansion, normal >5 cm at T4), cervical (global decrease, often extension first)
- postural changes: decreased lumbar lordosis + increased thoracic kyphosis + increased cervical flexion = increased occiput to wall distance (>5 cm)

• peripheral

- asymmetrical large joint arthritis, most often involving lower limb
- enthesitis: tenderness over tibial tuberosity, or Achilles tendon and plantar fascia insertions into the calcaneus

• extra-articular manifestations

- ophthalmic: acute anterior uveitis is common (25-30% patients)
- renal: amyloidosis (late and rare), IgA nephropathy
- gastrointestinal: IBD
- cardiac: aortitis, aortic regurgitation, pericarditis, conduction disturbances, heart failure (rare)
- respiratory: apical fibrosis (rare)
- neurologic: cauda equina syndrome (rare)
- skin: psoriasis

Investigations

- x-ray of SI joint: "pseudowidening" of joint due to erosion with joint sclerosis → bony fusion (late), symmetric sacroiliitis
- x-ray of spine: "squaring of edges" from erosion and sclerosis on corners of vertebral bodies (shiny corner sign) leading to ossification of outer fibres of annulus fibrosus (bridging syndesmophytes) → "bamboo spine" radiographically
- MRI of spine: assess activity in early disease; detection of cartilage changes, bone marrow edema, bone erosions, and subchondral bone changes. Best seen on T2 STIR (short tau inversion recovery) images (suppress fat and see bone edema)

Treatment

• non-pharmacological therapy

- prevent fusion from poor posture and disability through: exercise (e.g. swimming), postural and deep breathing exercises, outpatient PT, smoking cessation

• pharmacological therapy

- NSAIDs (first line of treatment)
- glucocorticoids (topical eye drops, local injections)
- DMARDs only for peripheral arthritis (sulfasalazine, MTX)
- anti-TNF agents for axial and peripheral involvement
- manage extra-articular manifestations

• surgical therapy

- hip replacement and vertebral osteotomy for marked deformity

Prognosis

- spontaneous remissions and relapses are common and can occur at any age
- function may be excellent despite spinal deformity
- favourable prognosis if female and age of onset >40 yr
- early onset with hip disease may lead to severe disability; may require arthroplasty

NORMAL POSTURE

Cervical lordosis
Thoracic kyphosis
Lumbar lordosis
Sacral kyphosis

ANKYLOSING SPONDYLITIS

Increased occiput to wall distance
Increased cervical flexion
Increased thoracic kyphosis
Decreased lumbar lordosis

© Cassandra Cetlin

Figure 12. AS postural change

FABER (Flexion, ABduction, and External Rotation) Test

Passively flex, abduct, then gently externally rotate the leg. If pain is elicited during this movement, the location of the pain may help determine the location of the patient's pathology (e.g. hip joint, sacroiliac joint)

Modified Schöber Test

Patient must be standing erect with normal posture

Mark an imaginary line connecting both posterior superior iliac spines (close to the dimples of Venus)

The next mark is placed 10 cm above
The patient bends forward maximally:
measure the difference

Report the increase (in cm to the nearest 0.1 cm)

The better of two tries is recorded

Extra-Articular Manifestations of AS

6 As

- Atlanto-axial subluxation
- Anterior uveitis
- Apical lung fibrosis
- Aortic incompetence
- Amyloidosis (kidneys)
- Autoimmune bowel disease (ulcerative colitis)

Both AS and EA feature symmetric sacroiliitis

Enteropathic Arthritis

- see [Gastroenterology, Inflammatory Bowel Disease, G19](#)
- MSK manifestations in the setting of either ulcerative colitis or Crohn's disease include peripheral arthritis (large joint, asymmetrical), spondylitis, and hypertrophic osteoarthropathy
- non-arthritic MSK manifestations can occur 2° to steroid treatment of bowel inflammation (arthralgia, myalgia, osteoporosis, AVN)
- NSAIDs should be used cautiously as they may exacerbate bowel disease

Table 28. Comparing Features of Spondylitis vs. Peripheral Arthritis in EA

Parameter	Spondylitis	Peripheral Arthritis
HLA-B27 Association	Yes	No
Gender	M>F	M=F
Onset Before IBD	Yes	No
Parallels IBD Course	No	Yes
Type of IBD	UC=CD	CD

Both AS and EA feature symmetric sacroiliitis

Psoriatic Arthritis

Definition

- arthritic inflammation associated with psoriasis

Etiology and Pathophysiology

- unclear but many genetic, immunologic, and some environmental factors involved (e.g. bacterial, viral, and trauma)

Epidemiology

- psoriasis affects 1% of population
- arthropathy in 15% of patients with psoriasis
- 15-20% of patients will develop joint disease before skin lesions appear

Signs and Symptoms

- **dermatologic**
 - well-demarcated erythematous plaques with silvery scale
 - nail involvement: pitting, transverse or longitudinal ridging, discolouration, subungual hyperkeratosis, onycholysis, and oil drops
- **musculoskeletal**
 - 5 general patterns
 - ◆ asymmetric oligoarthritis (most common – 70%)
 - ◆ arthritis of DIP joints with nail changes
 - ◆ destructive in small joints
 - ◆ symmetric polyarthritis (similar to RA)
 - ◆ sacroiliitis and spondylitis (usually older, male patients)
 - other findings: dactylitis, enthesopathy
- **ophthalmic**
 - conjunctivitis, iritis (anterior uveitis)
- **cardiac and respiratory** (late findings)
 - aortic insufficiency
 - apical lung fibrosis
 - neurologic
 - cauda equina syndrome
- **radiologic**
 - floating syndesmophytes
 - pencil-in-cup appearance at IP joints
 - osteolysis, periostitis

Check "hidden" areas for psoriatic lesions (ears, hair line, umbilicus, gluteal cleft, nails)
TNF- α inhibitors are effective treatments for PsA with no important added risks associated with their short-term use

Treatment

- treat skin lesions (e.g. steroid cream, salicylic and/or retinoic acid, tar, UV light)
- NSAIDs or IA steroids
- DMARDs (methotrexate, sulfasalazine or leflunomide); biologic therapies to minimize erosive disease (use early if peripheral joint involvement). The latter include anti-TNF agents, anti-IL-17 (secukinumab) and anti-IL-12/23 (ustekinumab)

Table 29. CASPAR Criteria for PsA*

Criterion	Description
1. Evidence of psoriasis	Current, past, or family history
2. Psoriatic nail dystrophy	Onycholysis, pitting, hyperkeratosis
3. Negative results for RF	
4. Dactylitis	Current or past history
5. Radiological evidence	Juxta-articular bone formation on hand or foot x-rays

* To meet the CASPAR (Classification criteria for Psoriatic ARthritis) criteria, a patient must have inflammatory articular disease (joint, spine, or entheses) with ≥ 3 points from the above 5 categories

Arthritis Rheum 2006 Aug;54(8):2665-73. Classification criteria for PsA: development

Reactive Arthritis

Definition

- one of the seronegative spondyloarthropathies in which patients have a peripheral arthritis (≥ 1 mo duration) accompanied by one or more extra-articular manifestations that appears shortly after certain infections of the GI or GU tracts
- this term should not be confused with rheumatic fever or viral arthritides.

Etiology

- onset following an infectious episode either involving the GI or GU tract
 - GI: *Shigella*, *Salmonella*, *Campylobacter*, *Yersinia*, *C. Difficile* species
 - GU: *Chlamydia* (isolated in 16-44% of ReA cases), *Mycoplasma* species
- acute clinical course
 - 1-4 wk post-infection
 - lasts weeks to years
 - often recurring
 - spinal involvement persists

Epidemiology

- in HLA-B27 patients, axial > peripheral involvement
- M>F

Signs and Symptoms

- **musculoskeletal**
 - peripheral arthritis, asymmetric pattern, spondylitis, Achilles tendinitis, plantar fasciitis, dactylitis
- **ophthalmic**
 - iritis (anterior uveitis), conjunctivitis
- **dermatologic**
 - keratoderma blennorrhagicum (hyperkeratotic skin lesions on palms and soles) and balanitis circinata (small, shallow, painless ulcers of glans penis and urethral meatus) are diagnostic
- **gastrointestinal**
 - oral ulcers, diarrhea
- **urethritis and cervicitis**
 - sterile pyuria; presence not related to site of initiating infection

Investigations

- diagnosis is clinical plus laboratory
- blood work: normocytic, normochromic anemia, and leukocytosis
- sterile cultures
- serology: HLA-B27 positive

Treatment

- antibiotics for non-articular infections
- NSAIDs, physical therapy, exercise
- local therapy
 - joint protection
 - IA steroid injection
 - topical steroid for ocular involvement
- systemic therapy
 - corticosteroids, sulfasalazine, MTX (for peripheral joint involvement only)
 - TNF- α inhibitors for spinal inflammation

Prognosis

- self-limited, typically 3-5 mo, varies based on pathogen and patient's genetic background
- chronic in 15-20% of cases

Clinical Triad of Reactive Arthritis

- Arthritis
- Conjunctivitis/uveitis
- Urethritis/cervicitis

"Can't See, Can't Pee, Can't Climb a Tree"

Triad of conjunctivitis, urethritis, and arthritis is 99% specific (but 51% sensitive) for ReA

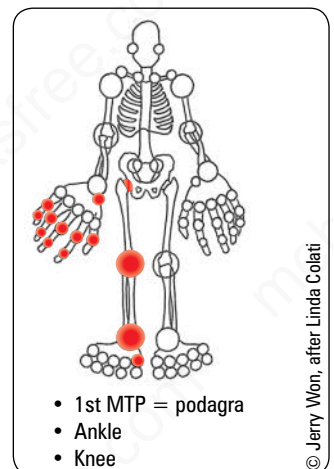

Figure 13. Common sites of involvement of gout (asymmetric joint involvement)

Crystal-Induced Arthropathies

Table 30. Gout vs. Pseudogout

Parameter	Gout	Pseudogout
Gender	M>F	M=F
Age	Middle-aged males	
Post-menopausal females	Age >60 yr	
Onset of Disease	Acute	Acute/insidious
Crystal Type	Monosodium urate Negative birefringence (yellow when parallel to compensator filter), needle-shaped	CPPD Positive birefringence (blue when parallel), rhomboid-shaped
Distribution	First MTP classically; also midfoot, ankle, knee, or polyarticular	Knee, wrist; monoarticular, or polyarticular if chronic
Radiology (note findings are non-specific)	Erosions	Chondrocalcinosis OA (knee, wrist, 2nd and 3rd MCP)
Treatment	Acute: NSAIDs, corticosteroids, colchicine Chronic: ± allopurinol, febuxostat	NSAIDs, corticosteroids

Gout

Definition

- derangement in purine metabolism resulting in hyperuricemia; monosodium urate crystal deposits in tissues (tophi) and synovium (microtophi)

Etiology and Pathophysiology

- uric acid can be obtained from the diet or made endogenously by xanthine oxidase, which converts xanthine to uric acid
- an excess of uric acid results in hyperuricemia
- uric acid can deposit in the tissues (tophi), synovium (microtophi) and bones, where they can crystalize to form monosodium urate crystals that lead to gout
- both modifiable and non-modifiable risk factors contribute to gout
- non-modifiable risk factors include: genetic mutations, male gender and advanced age
- modifiable risk factors include: diet (alcohol, purine rich foods such as meats and seafoods, fructose/sugar sweetened foods; see list of precipitants below)
- other risk factors: renal failure, metabolic syndrome, diuretics

Signs and Symptoms

- single episode progressing to recurrent episodes of acute inflammatory arthritis
- acute gouty arthritis**
 - severe pain, redness, joint swelling, usually involving lower extremities
 - joint mobility may be limited
 - attack will subside spontaneously within several days to weeks; may recur
- tophi**
 - urate deposits on cartilage, tendons, bursae, soft tissues, and synovial membranes
 - common sites: first MTP, ear helix, olecranon bursae, tendon insertions (common in Achilles tendon)
- kidney**
 - gouty nephropathy
 - uric acid calculi

Investigations

- joint aspirate: >90% of joint aspirates show crystals of monosodium urate (negatively birefringent, needle-shaped)
- x-rays may show tophi as soft tissue swelling, punched-out lesions, erosion with “over-hanging”
- correlated with hyperuricemia in the blood
- may see elevated WBC and ESR (nonspecific)

Treatment

- acute gout**
 - NSAIDs: high dose, then taper as symptoms improve
 - corticosteroids: IA, oral, or intra-muscular (if renal, cardiovascular or GI disease and/or if NSAIDs contraindicated or failed)
 - colchicine within first 12 h but effectiveness limited by narrow therapeutic range
 - allopurinol can worsen an acute attack (do not start during acute flare)

An acute gout attack may mimic cellulitis; however, joint mobility is usually preserved in cellulitis unless it overlaps a joint

Precipitants of Gout

Drugs are FACT

Furosemide
Aspirin® (low dose)/Alcohol
Cytotoxic drugs (cyclosporine)
Thiazide diuretics

Foods are SALT

Seafood
Alcohol (beer and spirits)
Liver and kidney
Turkey (meat)

The majority of people with hyperuricemia do not have gout
Normal or low uric acid levels do not rule out gout

10 Recommendations on the Diagnosis and Management of Gout

Ann of Rheum Dis 2013;73:328-335

- Identification of monosodium urate crystals should be performed for a definitive diagnosis of gout.
- Gout/hyperuricemia should prompt investigations of renal function and CV risk factors.
- Acute gout should be treated with colchicine, NSAIDs, and/or glucocorticoids.
- Patients should be counselled about lifestyle.
- Allopurinol is first line for urate lowering therapy, with uricosurics as second line.
- Patients should be informed about the risk of acute gout flare with initiation of urate lowering therapy; colchicine prophylaxis should be considered.
- Allopurinol can be used in patients with mild/moderate renal impairment with slow titration and monitoring.
- Treatment goal is urate <0.36 mM and absence of attacks and resolution of tophi.
- Tophi should be treated medically by lowering serum urate to <0.3 mM. Surgery is only for select cases.
- Prophylactic pharmacological management of asymptomatic hyperuricemia is not recommended.

- **chronic gout**
 - conservative
 - ♦ avoid foods with high purine content (e.g. visceral meats, sardines, shellfish, beans, peas)
 - ♦ avoid drugs with hyperuricemic effects (e.g. pyrazinamide, ethambutol, thiazide, alcohol)
 - medical
 - ♦ antihyperuricemic drugs (allopurinol and febuxostat): decrease uric acid production by inhibiting xanthine oxidase
 - ♦ uricosuric drugs (probenecid, sulfipyrazone): very rarely used in combination with allopurinol or febuxostat in patients in whom hyperuricemia is not controlled with the latter
 - prophylaxis prior to starting antihyperuricemic drugs (colchicine/low-dose NSAID)
 - in renal disease secondary to hyperuricemia, use low-dose allopurinol and monitor Cr
- indications for treatment with antihyperuricemic medications include
 - recurrent attacks (more than 2-3/yr), tophi, bone erosions, urate kidney stones
 - perhaps in renal dysfunction with very high urate load (controversial)

Pseudogout (Calcium Pyrophosphate Dihydrate Disease)

Definition

- joint inflammation caused by calcium pyrophosphate crystals

Etiology and Pathophysiology

- acute inflammatory arthritis due to phagocytosis of IgG-coated CPPD crystals by neutrophils and subsequent release of inflammatory mediators within joint space
- more frequently polyarticular
- slower in onset in comparison to gout, lasts up to 3 wk but is self-limited

Risk Factors

- old age, advanced OA, neuropathic joints
- other associated conditions: hyperparathyroidism, hypothyroidism, hypomagnesemia, hypophosphatasia (low ALP), DM, hemochromatosis

Signs and Symptoms

- affects knees, wrists, MCPs, hips, shoulders, elbows, ankles, big toe
- multiple manifestations
- asymptomatic crystal deposition (seen on radiograph only)
- acute crystal arthritis (self-limited flares of acute inflammatory arthritis resembling gout)
- pseudo-OA (progressive joint degeneration, sometimes with episodes of acute inflammatory arthritis)
- pseudo-RA (symmetrical polyarticular pattern with morning stiffness and constitutional symptoms)
- acute may be triggered by dehydration, acute illness, surgery, trauma

Investigations

- must aspirate joint to rule out septic arthritis, gout
- CPPD crystals: present in 60% of patients, often only a few crystals, positive birefringence (blue) and rhomboid shaped
- x-rays show chondrocalcinosis in 75%: radiodensities in fibrocartilaginous structures (e.g. knee menisci) or linear radiodensities in hyaline articular cartilage

Treatment

- joint aspiration, rest, and protection
- NSAIDs: also used for maintenance therapy
- prophylactic colchicine PO (controversial)
- IA or oral steroids to relieve inflammation

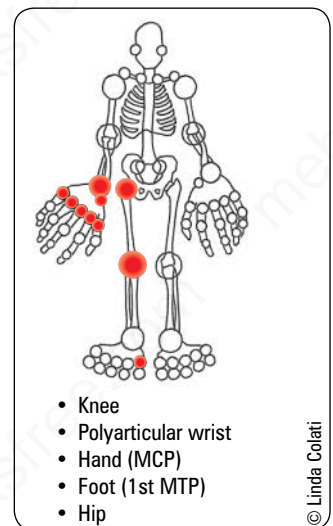

Figure 14. Common sites of involvement of CPPD

Non-Articular Rheumatism

Definition

- disorders that primarily affect soft tissues or periarticular structures
- includes bursitis, tendinitis, tenosynovitis, fibromyalgia, and PMR

Polymyalgia Rheumatica

Definition

- characterized by pain and stiffness of the proximal extremities (girdle area)
- closely related to GCA (15% of patients with PMR develop GCA)
- no muscle weakness

Table 31. PMR Classification Criteria Scoring Algorithm*

	Points without U/S (0-6)	Points with Abnormal U/S** (0-8)
Morning stiffness duration >45 min	2	2
Hip pain or limited ROM	1	1
Absence of RF or ACPA	2	2
Absence of other joint involvement	1	1
At least one shoulder with subdeltoid and/or biceps tenosynovitis and/or glenohumeral synovitis (either posterior or axillary) and at least one hip with synovitis and/or trochanteric bursitis on U/S	N/A	1
Both shoulders with subdeltoid bursitis, biceps tenosynovitis, or gleno-humeral synovitis on U/S	N/A	1

*Required criteria: age \geq 50 yr, bilateral shoulder aching, and abnormal ESR/CRP

**A score of 4 or more is categorized as PMR in the algorithm without U/S and a score of 5 or more is categorized as PMR in the algorithm with U/S

**Optional U/S criteria

Ann Rheum Dis 2012;71:484-492

Epidemiology

- incidence 50 per 100,000 per year in those >50 yr
- age of onset typically >50 yr, F:M = 2:1

Signs and Symptoms

- constitutional symptoms prominent (fever, weight loss, malaise)
- pain and stiffness of symmetrical proximal muscles (neck, shoulder and hip girdles, thighs)
- gel phenomenon (stiffness after prolonged inactivity)
- physical exam reveals tender muscles, but no weakness or atrophy

Investigations

- blood work: often shows anemia, elevated platelets, elevated ESR and CRP, and normal CK; up to 5% of PMR reported with normal inflammatory markers

Treatment

- goal of therapy: symptom relief
- start with prednisone dose of 15-20 mg PO OD, reconsider diagnosis if no response within several days
- taper slowly over 1 yr period with closely monitoring
- relapses should be diagnosed and treated on clinical basis; do not treat a rise in ESR as a relapse
- treat relapses aggressively (50% relapse rate)
- monitor for steroid side effects, glucocorticoid-induced osteoporosis prevention, and follow for symptoms of GCA

Fibromyalgia

Definition

- chronic (>3 mo), widespread (axial, left- and right-sided, upper and lower segment), non-articular pain with characteristic tender points

Diagnosis

Table 32. 2010 ACR Preliminary Diagnostic Criteria for Fibromyalgia

Criteria	Comments
Widespread Pain Index = number of areas in which the patient had pain over the last week (max score = 19): L and R: shoulder girdle, upper arm, lower arm, hip, upper leg, lower leg, jaw One Area: chest, abdomen, upper back, lower back, neck Symptom Severity Score = sum of: a) severity of fatigue b) waking unrefreshed c) cognitive symptoms over the past week d) extent of somatic symptoms (IBS, H/A, abdominal pain/cramps, dry mouth, fever, hives, ringing in ears, vomiting, heartburn, dry eyes, SOB, loss of appetite, rash, hair loss, easy bruising, etc.) all (a-d) rated on 0-3 scale: 0 = no problem, 1 = mild, 2 = moderate, 3 = severe	A patient satisfies diagnostic criteria for fibromyalgia if the following 3 conditions are met: 1. Widespread Pain Index (WPI) ≥ 7 and Symptom Severity (SS) scale score ≥ 5 or WPI 3-6 and SS scale score ≥ 9 2. Symptoms have been present at a similar level for at least 3 mo 3. The patient does not have a disorder that would otherwise explain the pain

Arthritis Care and Research 2010;62(5):600-610

Epidemiology

- F:M = 3:1
- primarily ages 25-45 yr, some adolescents
- prevalence of 2-5% in general population
- overlaps with chronic fatigue syndrome and myofascial pain syndrome
- strong association with psychiatric illness

Signs and Symptoms

- widespread aching, stiffness
- easy fatigability
- sleep disturbance: non-restorative sleep, difficulty falling asleep, and frequent waking
- symptoms aggravated by physical activity, poor sleep, emotional stress
- patient feels that joints are diffusely swollen although joint examination is normal
- neurologic symptoms of hyperalgesia, paresthesias
- associated with irritable bowel or bladder syndrome, migraines, tension H/As, restless leg syndrome, obesity, depression, and anxiety
- physical exam should reveal only tenderness with palpation of soft tissues, with no specificity for trigger/tender points

Investigations

- blood work: includes TSH and ESR; all typically normal unless unrelated, underlying illness present
- serology: do not order ANA or RF unless there is clinical suspicion for a connective tissue disease
- laboratory sleep assessment

Differential Diagnosis

- diagnosis of exclusion
- rule out other disorders by history and physical exam (RA, SLE, PMR, myositis, hypothyroidism, hyperparathyroidism, neuropathies)

Treatment

- **non-pharmacological therapy**
 - education
 - exercise program (walking, aquatic exercises), physical therapy (good posture, stretching, muscle strengthening, massage)
 - stress reduction, CBT
 - no evidence for alternative medicine such as biofeedback, meditation, acupuncture
- **pharmacological therapy**
 - low dose tricyclic antidepressant (e.g. amitriptyline)
 - for sleep restoration
 - select those with lower anticholinergic side effects
 - SNRI: duloxetine, milnacipran
 - anticonvulsant: pregabalin, gabapentin
 - analgesics may be beneficial for pain that interferes with sleep (NSAIDs, not narcotics)

Prognosis

- variable; usually chronic, unless diagnosed and treated early

Table 33. Clinical Features of Inflammatory Myopathy vs. Polymyalgia Rheumatica vs. Fibromyalgia

	Polymyositis	PMR	Fibromyalgia
Epidemiology	F > M, 40-50 yrs	F > M, > 50 yrs	F > M, 25-45 yrs
Muscle Involvement	Proximal muscle	Proximal muscle	Diffuse
Weakness	Yes	No	No
Pain	Painless	Painful	Painful
Stiffness	Mild	Significant morning and gelling stiffness (shoulders, neck, hips)	None
Investigations	Muscle biopsy, CK, EMG, R/O malignancy	ESR/CRP, R/O giant cell arteritis	Sleep assessment, TSH
ESR/CRP	Usually normal	Markedly elevated	Normal
Treatment	High dose steroids, immunosuppressants	Low dose steroids	Exercise, TCAs, SNRIs, anticonvulsants

Common Medications

Table 34. Common Medications for Osteoarthritis

Class	Generic Drug Name	Trade Name	Dosing (PO)	Indications	Contraindications	Adverse Effects
Analgesic	acetaminophen	Tylenol®	500 mg tid q4h (3 g daily max)	1st line		Hepatotoxicity Overdose Potentiates warfarin
NSAIDs	ibuprofen diclofenac diclofenac/misoprostol naproxen meloxicam	Voltaren® Arthrotec® Naprosyn®, Aleve® Mobicox®	200-600 mg tid 25-50 mg tid 50-75/200 mg tid 125-500 mg bid 7.5-15 mg OD	2nd line	GI bleed Renal impairment Allergy to ASA, NSAIDs Pregnancy (T3)	Nausea, tinnitus, vertigo, rash, dyspepsia, GI bleed, PUD, hepatitis, renal failure, HTN, nephrotic syndrome
COX-2 INHIBITORS						
	celecoxib	Celebrex®	200 mg OD	High risk for GI bleed: age >65 Hx of GI bleed, PUD	Renal impairment Sulfa allergy (celecoxib) Cardiovascular disease	Delayed ulcer healing Renal/hepatic impairment Rash
Other Treatments		Comments				
Combination analgesics (acetaminophen + codeine, acetaminophen + NSAIDs)		Enhanced short-term effect compared to acetaminophen alone More adverse effects: sedation, constipation, nausea, GI upset				
IA corticosteroid injection		Short-term (weeks-months) decrease in pain and improvement in function Used for management of an IA inflammatory process when infection has been ruled out				
IA hyaluronic acid q6mo		Used for mild-moderate OA of the knees, however little supporting evidence, and not considered to be effective Precaution with chicken/egg allergy				
Topical NSAIDs		25% wt/wt topical diclofenac (Pennsaid®) May use for patients who fail acetaminophen treatment and who wish to avoid systemic therapy				
Capsaicin cream		Mild decrease in pain				
Glucosamine sulfate ± chondroitin		Limited clinical studies. No regulation by Health Canada				

Table 35. Disease Modifying Anti-Rheumatic Drugs (DMARDs)

Generic Drug Name	Trade Name	Dosing	Contraindications	Adverse Effects
COMMONLY USED				
hydroxychloroquine \$	Plaquenil®	400 mg PO OD initially 200-400 mg PO OD maintenance (6.5 mg/kg ideal body weight per day)	Retinal disease, G6PD deficiency	GI symptoms, skin rash, macular damage, neuromyopathy Requires regular ophthalmological screening to monitor for retinopathy
sulfasalazine \$	Salazopyrim® Azulfidine® (US)	1000 mg PO bid-tid	Sulfa/ASA allergy, kidney disease, G6PD deficiency	GI symptoms, rash, H/A, leukopenia
methotrexate \$	Rheumatrex® Folex/Mexate®	7.5-25 mg PO/IM/SC qweekly	Bone marrow suppression, liver disease, significant lung disease, immunodeficiency, pregnancy, EtOH abuse	Oral ulcers, GI symptoms, cirrhosis, myelosuppression, pneumonitis, tubular necrosis
leflunomide \$\$	Arava®	10-20 mg PO OD	Liver disease	Alopecia, GI symptoms, liver dysfunction, pulmonary infiltrates
NOT COMMONLY USED				
cyclosporine \$\$	Neoral®	2.5-3 mg/kg/d divided and given in 2 doses PO	Kidney/liver disease, infection, HTN	HTN, decreased renal function, hair growth, tremors, bleeding
gold (injectable) \$	Solganal® Mycrysine®	50 mg IM q1wk after gradual introduction	IBD, kidney/liver disease	Rash, mouth soreness/ulcers, proteinuria, marrow suppression
azathioprine \$	Imuran®	2/5 mg/kg/d PO once daily	Kidney/liver disease TPMT deficiency	Rash, pancytopenia (especially ↓ WBC, ↑ AST, ALT), biliary stasis, vomiting, diarrhea
cyclophosphamide \$	Cytosan®	1 g/m ² /mo IV as per protocol	Kidney/liver disease	Cardiotoxicity, GI symptoms, hemorrhagic cystitis, nephrotoxicity, bone marrow suppression, sterility
Generic Drug Name	Trade Name	Dosing	Mechanism of Action	
NEWER DMARDs (Biologics)				
etanercept \$\$\$	Enbrel®	25 mg biweekly or 50 mg weekly SC	Fusion protein of TNF receptor and Fc portion of IgG	
infliximab \$\$\$	Remicade®	3-5 mg/kg IV q8wk	Chimeric mouse/human monoclonal anti-TNF	
adalimumab \$\$\$	Humira®	40 mg SC q2wk	Monoclonal anti-TNF	
golimumab \$\$\$	Simponi®	50 mg SC q mo	Monoclonal anti-TNF	
certolizumab \$\$\$	Cimzia®	400 mg SC q2wk x3 then 200 mg SC q4wk	PEGylated monoclonal anti-TNF	
Apremilast \$\$\$	Otezla®	Day 1: 10mg (AM), titrate up to 30mg BID by Day 6	Inhibitor of PDE4 which inhibits production of TNF α	
abatacept \$\$\$	Orencia®	IV infusion	Costimulation modulator of T-cell activation	
rituximab \$\$\$	Rituxan®	2 IV infusions, 2 wk apart	Causes B-cell depletion, binds to CD20	
tocilizumab \$\$\$	Actemra®	4-8 mg/kg IV q4wk	Interleukin-6 receptor antagonist	
Tofacitinib \$\$	Xeljanz®	5mg BID	Inhibits the JAK enzyme and thus interferes with JAK-STAT signaling pathway	

**Risks of Biologics**

Reactivation of TB or hepatitis B. Patients require negative TB skin test, chest x-ray and negative hepatitis B virus serology prior to starting any of these medications
Increased risk of: serious infections, worsening heart failure, multiple sclerosis, and positive auto-antibodies

Landmark Rheumatology Trials

Trial	Reference	Results
RHEUMATOID ARTHRITIS		
ATTEST	<i>Ann Rheum Dis</i> 2008;67:1096-103	Abatacept and infliximab have similar efficacy in RA patients who have failed MTX
ATTRACT	<i>Lancet</i> 1999;354:1932-9	Infliximab and MTX combined are more effective than MTX alone for patients with active RA
CIMESTRA	<i>Arthritis Rheum</i> 2006;54:1401-9	Combination of MTX and sulfasalazine is superior to either alone
COMET	<i>Lancet</i> 2008;372:375-82	Etanercept add-on therapy increases rates of remission in early RA
ERA	<i>NEJM</i> 2000;343:1586-93	Etanercept more rapidly decreases symptoms in early RA compared to MTX
European Leflunomide Study Group	<i>Lancet</i> 1999;353:259-66	Leflunomide is equal in efficacy to sulphasalazine and superior to placebo
FIN-RACo	<i>Lancet</i> 1999;353:1568-73	Combination therapy with DMARDs improves remission rates in early RA
Infliximab and MTX	<i>NEJM</i> 2000;343:1594-602	Infliximab combined with MTX reduces joint damage in RA
Leflunomide Rheumatoid Arthritis Investigators Group	<i>Arch Intern Med</i> 1999;159:2542-50	Leflunomide is equivalent to MTX therapy and superior to placebo
PREMIER	<i>Arthritis Rheum</i> 2006;54:26-37	Combination therapy with adalimumab and MTX is superior to either alone in patients with early RA
Swefot	<i>Lancet</i> 2009;374:459-66	Anti-TNF agents are more effective second-line therapy than DMARDs in patients who fail MTX
OSTEOARTHRITIS		
GAIT	<i>NEJM</i> 2006;354:795-808	Glucosamine, chondroitin, and the combination of both are no more effective than placebo in treatment of knee OA
Hyaluronan	<i>Ann Rheum Dis</i> 2010;69:1097-102	Hyaluronan injections do not improve disease activity in patients with moderate-severe knee OA
SLE		
Belimumab	<i>Lancet</i> 2011;377:721-31	Treatment with belimumab reduces the incidence of BILAG A and B flares in patients with SLE compared to placebo
BILAG open-RCT	<i>Rheumatology</i> 2010;49:723-32	Low dose cyclosporine and azathioprine are equivalent in efficacy as maintenance therapy for SLE
Mycophenylate mofetil or intravenous cyclophosphamide	<i>NEJM</i> 2005;353:2219-28	Mycophenylate mofetil is more efficacious than cyclophosphamide in inducing remission of SLE nephritis
CONNECTIVE TISSUE DISEASES		
Azathioprine or MTX maintenance for ANCA-associated vasculitis	<i>NEJM</i> 2008;359:2790-803	MTX and azathioprine are equally safe and effective as maintenance agents in ANCA vasculitis
Cyclophosphamide in scleroderma lung disease	<i>NEJM</i> 2006;354:2655-66	Cyclophosphamide therapy leads to transient improvements in lung function, skin scores, and overall health in patients with scleroderma
Etanercept plus standard therapy for granulomatosis with polyangiitis	<i>NEJM</i> 2005;352:351-61	Etanercept is not effective in inducing remission in patients with ANCA vasculitis
Mycophenylate mofetil vs. azathioprine for maintenance in ANCA-associated vasculitis	<i>JAMA</i> 2010;304:2381-8	Mycophenylate mofetil is less effective than azathioprine for maintaining disease in ANCA-associated vasculitis
Rituximab versus cyclophosphamide for ANCA-associated vasculitis	<i>NEJM</i> 2010;363:221-32	Rituximab is not inferior to cyclophosphamide for induction of remission in ANCA vasculitis
GOUT		
Febuxostat vs. allopurinol	<i>NEJM</i> 2005;353:2450-61	Febuxostat is more effective than allopurinol at lowering serum urate, and has similar effectiveness on flare reduction
ANKYLOSING SPONDYLITIS		
Adalimumab	<i>Arthritis Rheum</i> 2006;54:2136-46	Adalimumab induced partial remission in 22% of AS patients
ASSERT (rituximab)	<i>Arthritis Rheum</i> 2005;52:582-91	Sixty percent of patients treated with rituximab had a clinical response to the medication
ATLAS (adalimumab)	<i>J Rheumatol</i> 2008;35:1346-53	Compared to placebo, adalimumab significantly reduces pain and fatigue in AS patients
Infliximab in AS	<i>Lancet</i> 2002;359:1187-93	Infliximab induces regression of symptoms in 50% of patients and is superior to placebo
SPINE (etanercept)	<i>Ann Rheum Dis</i> 2011;70:799-804	Etanercept has short-term efficacy for patients with advanced AS and reduces disease severity
Sulfasalazine	<i>Arthritis Rheum</i> 1995;38:618-27	Sulfasalazine is superior to placebo in treatment of patients with seronegative spondyloarthropathy

Basic Anatomy Review

- recall that the anatomical position of the penis is erect; therefore, the anatomical ventral side of the penis appears to be the dorsal side of the flaccid penis

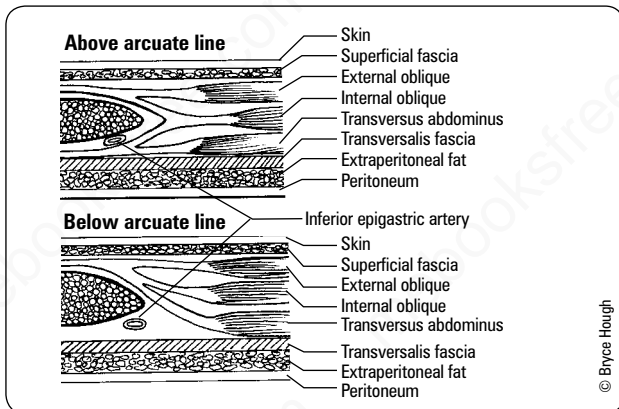

Figure 1. Midline cross-section of abdominal wall

Figure 2. Anatomy of scrotum

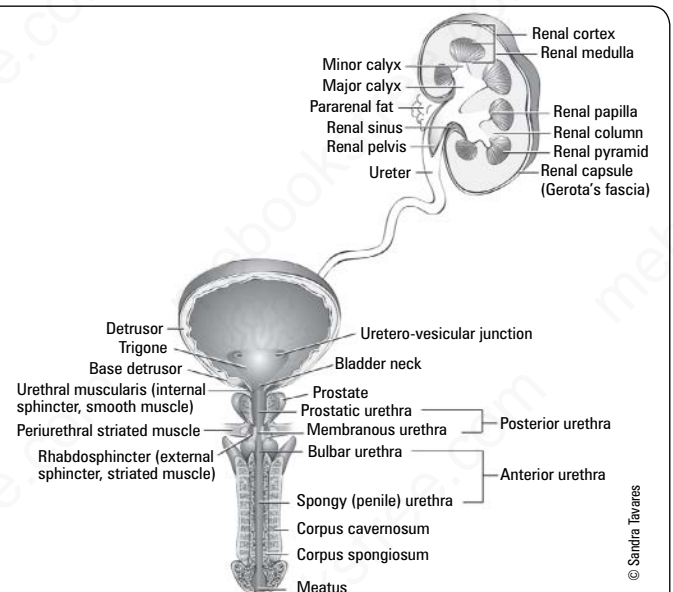

Figure 3. Essential male genitourinary tract anatomy

Urologic History

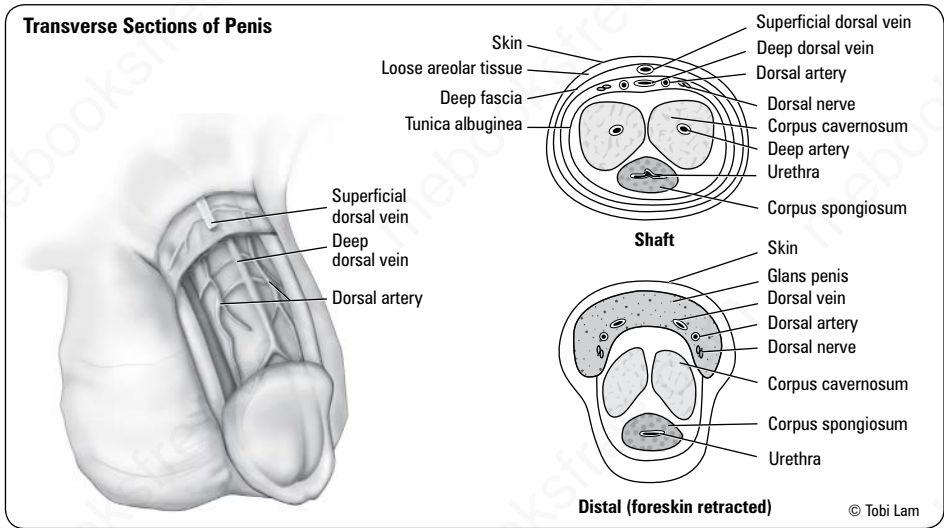

Figure 4. Cross section of the penis

Figure 5. Median sagittal section of the male pelvis and perineum

Urologic History

- follow OPQRSTUVW approach
 - note that pain may not be limited to the genital region (e.g. lower abdomen, CVA)
- inquire about risk factors: past urologic disease (e.g. UTI, stones, STI, cancers, anatomic abnormalities), family Hx, medications, lifestyle factors (smoking, alcohol, inactivity), trauma, previous surgical procedures
- urinary habits
 - frequency of voiding, incontinence, nocturia
 - specific urinary symptoms include
 - ♦ storage symptoms: frequency, nocturia, incontinence, urgency (rush to toilet), stress (leak with cough/laughter)
 - ♦ voiding symptoms: straining, hesitancy, dysuria, intermittency, post-void dribbling, reduced stream, feeling of incomplete voiding
 - hematuria: blood clots, red/pink tinged urine
- sexual function
 - scrotal mass: *see Scrotal Mass, U29*
 - ED: *see Erectile Dysfunction, U30*
 - infertility: *see Infertility, U34*
- associated symptoms
 - N/V
 - bowel dysfunction
- constitutional symptoms
 - fever, chills, unintentional weight loss, night sweats, fatigue, malaise, bone pain

Always ask about sexual function on history. Change in erectile function can be one of the first symptoms that there is concomitant vascular disease. If there is new onset ED, consider screening for DM and CAD risk factors

Hematuria (Blood in the Urine)

Macroscopic (Gross) Hematuria

Definition

- blood in the urine that can be seen with the naked eye

Classification

- see [Nephrology, NP21](#)

Etiology

Table 1. Etiology by Age Group

Age (yr)	Etiology
0-20	UTI, glomerulonephritis, congenital abnormalities
20-40	UTI, stones, bladder tumour, exercise
40-60	Male: bladder tumour, stones, UTI Female: UTI, stones, bladder tumour
>60	Male: BPH, bladder tumour, UTI, RCC Female: bladder tumour, UTI, RCC

Table 2. Etiology by Type

Pseudo-hematuria	Infectious/ Inflammatory	Malignancy	Benign	Structural	Hematologic
Vaginal bleeding Dyes (beets, rhodamine B in candy and juices) Hemoglobin (hemolytic anemia) Myoglobin (rhabdomyolysis) Drugs (rifampin, phenazopyridine, phenytoin) Porphyria Laxatives (phenolphthalein)	Pyelonephritis Cystitis Urethritis Glomerulonephritis Interstitial nephritis Tuberculosis	RCC (mainly adults) UCC Wilms' tumour (mainly pediatric) Leukemia	BPH Polyps Exercise-induced	Stones Trauma Foreign body Urethral stricture Polycystic kidneys Arteriovenous malformation Infarct Hydronephrosis Fistula	Anticoagulants Coagulation defects Sickle cell disease Thromboembolism

History

- timing of hematuria in urinary stream
 - initial: anterior urethra
 - terminal: bladder neck and prostatic urethra
 - total: bladder and/or above
- associated symptoms (storage and voiding)
 - pyuria, dysuria: UTI
 - flank pain, radiation: ureteral obstruction
- recent URTI: post-infectious glomerulonephritis, IgA nephropathy

Investigations

- CBC (rule out anemia, leukocytosis), electrolytes, Cr, BUN, INR, PTT
- urine studies
 - U/A, C&S, cytology
- imaging
 - CT contrast has largely replaced IVP to investigate upper tracts
 - consider contraindications: allergy, renal insufficiency, pregnancy
 - U/S alone may not be sufficient
 - cystoscopy to investigate lower tract (possible retrograde pyelogram)

Acute Management of Severe Bladder Hemorrhage

- manual irrigation via catheter with normal saline to remove clots
- Continuous Bladder Irrigation (CBI) using large (22-26 Fr) 3-way Foley to help prevent clot formation
- cystoscopy if active bleeding
 - identify resectable tumours
 - coagulate obvious sites of bleeding
- refractory bleeding
 - bilateral nephrostomy tube placement
 - hyperbaric oxygen
 - intravesical agents
 - continuous intravesical irrigation with 1% aluminum potassium sulfate solution as needed
 - intravesical instillation of 1% silver nitrate solution
 - intravesical instillation of 1-4% formalin (requires GA and pre-procedure cystogram to rule out reflux)
 - embolization or ligation of iliac branches
 - cystectomy and diversion (rarely performed)

Gross, painless hematuria in adults is bladder cancer until proven otherwise

Common Urologic Causes of Hematuria can be Classified as:

TICS

Trauma/Tumour/Toxins
Infection/Inflammatory
Calculi/Cysts
Surgery/Sickle cell and other hematological causes

Upper Tract Imaging Options

CT Urography (CTU): test of choice for renal parenchyma, calculi, and infections. Involves exposure to radiation and IV contrast (assess renal function and allergies)

U/S: Superior to IVP for evaluation of renal parenchyma and renal cysts; limited sensitivity for UCC and small renal masses; U/S alone is insufficient for upper tract imaging

Intravenous Pyelogram (IVP): Traditional option but rarely used (replaced by CTU); reasonable sensitivity for UCC, but poor sensitivity for RCC

Microscopic Hematuria

Definition

- blood in the urine that is not visible to the naked eye
- ≥ 2 RBCs/HPF on urinalysis of at least two separate samples

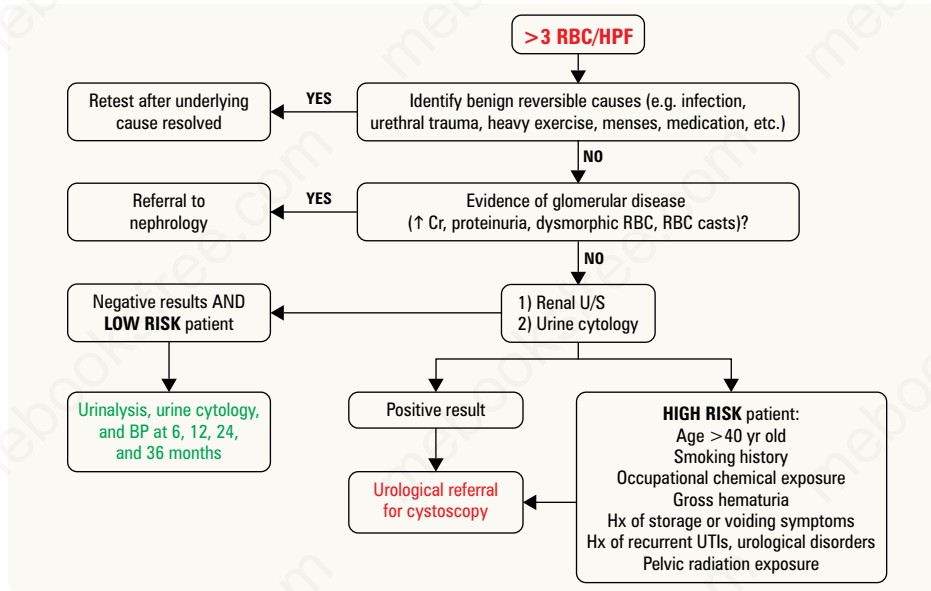

Figure 6. Workup of asymptomatic microscopic hematuria

Based on CUA Guidelines. Alternatively, the AUA recommends cystoscopy and CT urogram for all patients with confirmed microscopic hematuria; follow-up for negative workup is urinalysis yearly for two years, with repeat anatomic evaluation if microscopic hematuria persists

Lower Urinary Tract Dysfunction

- see [Gynecology](#) for relevant female topics
- the lower urinary tract consists of the bladder and urethra. LUTD frequently involves both parts

Voiding

- two phases of lower urinary tract function
 1. storage phase (bladder filling and urine storage)
 - ♦ accommodation and compliance
 - ♦ no involuntary contraction(s)
 2. voiding phase (bladder emptying)
 - ♦ coordinated detrusor contraction
 - ♦ synchronous relaxation of outlet sphincters
 - ♦ no anatomic obstruction
- voiding dysfunction can therefore be classified as
 - failure to store: due to bladder or outlet
 - failure to void: due to bladder or outlet
- three types of symptoms
 - storage (formerly known as irritative)
 - voiding (formerly known as obstructive)
 - post-voiding

Urinary Incontinence

Definition

- involuntary leakage of urine

Etiology

- urgency incontinence
 - detrusor overactivity
 - ♦ CNS lesion, inflammation/infection (cystitis, stone, tumour), bladder neck obstruction (tumour, stone), BPH, idiopathic
 - decreased compliance of bladder wall (inability to store urine)
 - ♦ CNS lesion, fibrosis
 - ♦ sphincter/urethral problem

- stress urinary incontinence (SUI)
 - common in women; seen in men after prostate cancer treatment or pelvic operations
 - urethral hypermobility
 - ♦ weakened pelvic floor and musculofascial urethral and vaginal supporting mechanisms allows bladder neck and urethra to descend with increased intra-abdominal pressure
 - ♦ urethra is pulled open by greater motion of posterior wall of outlet relative to anterior wall
 - ♦ associated with childbirth, pelvic surgery, aging, levator muscle weakness, obesity
 - intrinsic sphincter deficiency (ISD): weakness of the urethra and associated smooth and striated muscle elements
 - pelvic surgery, neurologic problem, aging and hypoestrogen state
 - ISD and urethral hypermobility frequently co-exist
- mixed incontinence
 - combination of stress and urgency incontinence
- overflow incontinence
 - is a term sometimes used to describe urinary incontinence associated with urinary retention; for causes of urinary retention see Table 4
 - use of the term should be accompanied by the associated pathophysiology (e.g. BPH with overflow incontinence)

Epidemiology

- variable prevalence in women: 25-45%
- F:M = 2:1
- more frequent in the elderly, affecting 5-15% of those living in the community and 50% of nursing home residents

Table 3. Urinary Incontinence: Types and Treatments

Type	Urgency	Stress	Mixed
Definition	Involuntary leakage of urine preceded by a strong, sudden urge to void	Involuntary leakage of urine with sudden increases in intra-abdominal pressure	Urinary leakage associated with urgency and increased intra-abdominal pressure
Etiology	Bladder (detrusor overactivity)	Urethra/sphincter weakness, post-partum pelvic musculature weakness	Combination of bladder and sphincter issues
Diagnosis	Hx Urodynamics	Hx Urodynamics Stress test (Valsalva/cough)	Hx Urodynamics Stress test
Therapy	Lifestyle changes (fluid alterations, diet, etc.) Bladder habit training Anticholinergics β-3-agonist Botulinum toxin A Neuromodulation	Weight loss Kegel exercises Bulking agents Surgery (slings, tension-free vaginal tape, retropubic urethropexy, artificial sphincter)	Combination of management of urgency and stress incontinence

Lower Urinary Tract Symptoms (LUTS)

Storage (FUND)

- Frequency
- Urgency
- Nocturia
- Dysuria

Voiding (SHED)

- Stream changes
- Hesitancy
- Incomplete Emptying
- Dribbling

Causes of Reversible Urinary Incontinence

DIAPERS

- Delirium
- Inflammation/Infection
- Atrophic vaginitis/urethritis
- Pharmaceuticals/Psychological
- Excess U/O
- Restricted mobility/Retention
- Stool impaction

Urgency is the symptom of a strong need to void; it is not necessarily associated with incontinence

Lower Urinary Tract Symptoms (LUTS)

Urinary Retention

Table 4. Etiology of Urinary Retention

Outflow Obstruction	Bladder Innervation	Pharmacologic	Infection
Bladder neck or urethra: calculus, clot, foreign body, neoplasm, neurological (DSD) Prostate: BPH, prostate cancer Urethra: stricture, phimosis, traumatic disruption Miscellaneous: constipation, pelvic mass	Intracranial: CVA, tumour, Parkinson's, cerebral palsy Spinal cord: injury, disc herniation, MS DM Post-abdominal or pelvic surgery	Anticholinergics Narcotics Antihypertensives (ganglionic blockers, methyldopa) OTC cold medications containing ephedrine or pseudoephedrine Antihistamines Psychosomatic substances (e.g. ecstasy)	GU: UTI, prostatitis, abscess, genital herpes Infected foreign body Varicella zoster

Clinical Features

- suprapubic pain (with acute retention), incomplete emptying, weak stream
- palpable and/or percussible bladder (suprapubic)
- possible purulent/bloody meatal discharge (with UTI)
- increased size of prostate or reduced anal sphincter tone on DRE
- neurological: presence of abnormal or absent deep tendon reflexes, reduced "anal wink", saddle anesthesia

Acute vs. Chronic Retention

Acute retention is a medical emergency characterized by suprapubic pain and anuria with normal bladder volume and architecture
Chronic retention can be painless with greatly increased bladder volume and detrusor hypertrophy followed by atony (late)

If a trauma patient is unable to void, has blood at urethral meatus, a scrotal hematoma, or a high riding prostate, there is urethral injury until proven otherwise so catheterization is CONTRAINDICATED unless performed by urology staff or resident

Investigations

- CBC, electrolytes, Cr, BUN, U/A and urine C&S, U/S, cystoscopy, urodynamic studies, PVR

Treatment

- treat underlying cause
- catheterization
 - acute retention
 - ♦ immediate catheterization to relieve retention; leave Foley in to drain bladder; follow-up to determine cause; closely monitor fluid status and electrolytes (risk of POD)
 - chronic retention
 - ♦ intermittent catheterization by patient may be used; definitive treatment depends on etiology
- suprapubic catheter if obstruction precludes urethral catheter
- for post-operative patients with retention:
 - encourage ambulation
 - α -blockers to relax bladder neck outlet
 - may need catheterization
 - definitive treatment will depend on etiology

Patients with ascites may have a falsely elevated PVR measured by bladder scan

Figure 7. Cross-section of prostate

Prostate size does not correlate well with symptoms in BPH

Approximate Prostate Sizes
 20 cc – chestnut
 25 cc – plum
 50 cc – lemon
 75 cc – orange
 100 cc – grapefruit

AUA BPH Symptom Score

FUNWISE

Frequency
 Urgency
 Nocturia
 Weak stream
 Intermittency
 Straining
 Emptying, incomplete feeling of

Each symptom graded out of 5
 0-7: Mildly symptomatic
 8-19: Moderately symptomatic
 20-35: Severely symptomatic
 Note: dysuria not included in score but is commonly associated with BPH

Initial alpha-adrenergic antagonist monotherapy for score <20, combination therapy for score >20

Benign Prostatic Hyperplasia

Definition

- periurethral hyperplasia of stroma and epithelium in prostatic transition zone
- prostatic smooth muscle cells play a role in addition to hyperplasia

Etiology

- unknown
 - DHT required (converted from testosterone by 5- α reductase)
 - possible role of impaired apoptosis, estrogens, other growth factors

Epidemiology

- age-related, extremely common (50% of 50 yr olds, 80% of 80 yr olds)
- 25% of men will require treatment

Clinical Features

- result from outlet obstruction and compensatory changes in detrusor function
- voiding and storage symptoms
- DRE
 - prostate is smooth, rubbery, and may be symmetrically enlarged
- complications
 - retention
 - overflow incontinence
 - hydronephrosis
 - renal insufficiency
 - infection
 - gross hematuria
 - bladder stones

Investigations

- Hx, assessing LUTS and impact on QOL
 - may include self-administered questionnaires (IPSS or AUA symptom index for severity, progression, and treatment response)
- P/E, including DRE
- U/A to exclude UTI
- Cr to assess renal function
- renal U/S to assess for hydronephrosis
- PSA to rule out malignancy (see *Prostate Cancer Screening, U26*)
- uroflowmetry to measure flow rate (optional)
- PVR (optional)
- consider cystoscopy or bladder ultrasound prior to potential surgical management to evaluate outlet and prostate volume
- biopsy if suspicious for malignancy, i.e. elevated PSA or abnormal DRE

Treatment

Table 5. Treatment of BPH

	Conservative	Medical	Surgical	Minimally Invasive Surgical Therapies
When to use	Asymptomatic patients or symptomatic without bother	Moderate to severe symptoms that are distressing for patient	Significant symptom burden, acute urinary retention, refractory hematuria, recurrent infections	Patients who wish to avoid or may not tolerate surgery
Options	Watchful waiting: 50% of patients improve spontaneously	Lifestyle modifications (e.g. evening fluid restriction, planned voiding) α-adrenergic antagonists: reduce stromal smooth muscle tone 5-α reductase inhibitor: block conversion of testosterone to DHT; act to reduce prostate size Combination is synergistic Anti-cholinergic agents or β-3 agonist (for storage LUTS, without elevated PVR)	TURP (see U41) Laser ablation TUIP (prostate <30 g) Open prostatectomy	Microwave therapy TUNA Prostatic stent (not commonly used)

Men with planned cataract surgery should avoid starting α-adrenergic antagonists until after their surgery due to the risk of intraoperative floppy iris syndrome

BPH Surgery

Absolute Indication

Renal failure with obstructive uropathy
Refractory urinary retention

Relative Indications

Recurrent UTIs
Recurrent hematuria refractory to medical treatment
Renal insufficiency (rule out other causes)
Bladder stones

Combination therapy vs. alpha blocker or 5ARI

BJU Int 2011;107(6):946-54

Summary: Men with baseline prostate volume ≥40mL and baseline PSA ≥1.5 ng/mL had greater reductions in RR of BPH-related surgery and RR of clinical progression on combined therapy or dutasteride monotherapy than on tamsulosin monotherapy.

Methods: 4-year combination of dutasteride and tamsulosin study was a multicentre double-blind RCT of outcomes in men ≥50 years old with symptomatic BPH, with PSA ≥1.5ng/mL and ≤10ng/mL, and prostate volume ≤30mL. Patients received tamsulosin, dutasteride or combination therapy. Primary endpoint was time to first acute urinary retention or BPH-related surgery; secondary endpoint was clinical progression of BPH/symptoms.

Results: Combination therapy resulted in significantly greater improvements in symptoms compared to dutasteride from 3 mo, and tamsulosin from 9 mo, and in BPH-related health status from 3 and 12 mo, respectively. There was a significant increase in ADE with combination therapy vs. monotherapies. However, withdrawal rates due to drug-related adverse events were similar across the treatment groups.

Finasteride for Benign Prostatic Hyperplasia

Cochrane DB Syst Rev 2010;10:CD006015

Purpose: To examine the effectiveness and safety of finasteride versus placebo or other active controls for the treatment of urinary tract symptoms.

Summary of Findings:

1. Finasteride improved urinary symptoms more than placebo in trials > 1 yr duration and significantly lowered the risk of BPH progression.
2. Compared with α-blockers, finasteride was less effective than either doxazosin or terazosin, but equally as effective as tamsulosin.
3. Symptom improvement with finasteride + doxazosin is equal to doxazosin alone.
4. Finasteride treatment resulted in an increased risk of ejaculation disorder, impotence and lowered libido compared with placebo.
5. Compared with doxazosin and terazosin, finasteride had a lower risk of asthenia, dizziness, and postural hypotension.

Urethral Stricture

Definition

- decrease in urethral calibre due to scar formation in urethra (may also involve corpus spongiosum)
- M>F

Etiology

- congenital
 - failure of normal canalization (i.e. posterior urethral valves)
- trauma
 - instrumentation/catheterization (most common)
 - external trauma (e.g. burns, straddle injury)
 - foreign body
- infection
 - long-term indwelling catheter
 - STI (gonococcal or chlamydial disease)
- inflammation
 - balanitis xerotica obliterans (BXO); lichen sclerosis or chronic progressive sclerosing dermatosis of the male genitalia) causing meatal and urethral stenosis

Clinical Features

- voiding and storage symptoms
- urinary retention
- hydronephrosis
- related infections: recurrent UTI, secondary prostatitis/epididymitis

Investigations

- laboratory findings
 - flow rates <10 mL/s (normal ~20 mL/s) on uroflowmetry
 - urine culture usually negative, but U/A may show pyuria
- radiologic findings
 - RUG and VCUG will demonstrate location
- cystoscopy

Treatment

- urethral dilatation
 - temporarily increases lumen size by breaking up scar tissue
 - healing will often reform scar tissue, recurrence of stricture
- visual internal urethrotomy (VIU)
 - endoscopically incise stricture
 - equal success rates to dilation with mid bulbar strictures <2 cm
 - high rate of recurrence (30-80%), avoid in younger patients
- open surgical reconstruction
 - complete stricture excision with anastomosis, ± urethroplasty depending on location and size of stricture

Neurogenic Bladder

Definition

- dysfunction of the urinary bladder due to deficiency in some aspect of its innervation

Neurophysiology

Table 6. Efferent Sympathetic, Parasympathetic, and Somatic Nerve Supply

Nerve Fibres	Nerve Roots	Neurotransmitter/Receptor	Target
Sympathetic	T10-L2	NA/Adrenergic	Trigone, internal sphincter, proximal urethra (α receptors) Bladder body (β receptors))
Somatic (Pudendal)	S2-4	ACh/Nicotinic	External sphincter
Parasympathetic	S2-4	ACh/Muscarinic (M2, M3)	Detrusor

- stretch receptors in the bladder wall relay information to PMC and activate micturition reflex (normally inhibited by cortical input)
 - micturition
 - stimulation of parasympathetic neurons (bladder contraction)
 - inhibition of sympathetic and somatic neurons (internal and external sphincter relaxation, respectively)
 - urine storage
 - opposite of micturition
- voluntary action of external sphincter (pudendal nerve roots S2-S4) can inhibit urge to urinate
- cerebellum, basal ganglia, thalamus, and hypothalamus all have input at PMC in the brainstem

Examples of Neurologic Voiding Dysfunction

- neurogenic detrusor overactivity (NDO) (formerly termed detrusor hyperreflexia)
 - lesion above PMC (e.g. stroke, tumour, MS, Parkinson's disease)
 - loss of voluntary inhibition of voiding
 - intact pathway inferior to PMC maintains coordination of bladder and sphincter
- detrusor sphincter dyssynergia (DSD)
 - suprasacral lesion of spinal cord (e.g. trauma, MS, arteriovenous malformation, transverse myelitis)
 - loss of coordination between detrusor and sphincter (detrusor contracts on closed sphincter and vice versa)
 - component of detrusor overactivity as well
- detrusor atony/areflexia
 - lesion of sacral cord or peripheral efferents (e.g. trauma, DM, disc herniation, MS, congenital spinal cord abnormality, post abdominoperineal resection)
 - flaccid bladder which fails to contract
 - may progress to poorly compliant bladder with high pressures
- peripheral autonomic neuropathy
 - deficient bladder sensation \rightarrow increasing residual urine \rightarrow decompensation (e.g. DM, neurosyphilis, herpes zoster)
- muscular lesion
 - can involve detrusor, smooth/striated sphincter

Neuro-Urologic Evaluation

- Hx and P/E (urologic and general neurologic)
- voiding diary
- catheterization volumes in patients with CIC
- U/A, renal profile
- imaging
 - U/S to rule out hydronephrosis and stones; occasionally CT scanning with or without contrast
- cystoscopy
- urodynamic studies
 - uroflowmetry to assess flow rate, pattern
 - filling CMG to assess capacity, compliance, detrusor overactivity
 - voiding CMG (pressure-flow study) to assess bladder contractility and extent of bladder outflow obstruction
 - video study to visualize bladder/bladder neck/urethra during CMG using x-ray contrast
 - EMG and video ascertain presence of coordinated or uncoordinated voiding, allows accurate diagnosis of DSD

Treatment

- goals of treatment
 - prevent renal deterioration
 - prevent infections
 - achieve social continence

Microwave Thermotherapy for Benign Prostatic Hyperplasia

Cochrane DB Syst Rev 2012;9:CD004135

Purpose: To evaluate the efficacy and safety of microwave thermotherapy for the treatment of benign prostatic obstruction.

Selection Criteria: RCTs evaluating transurethral microwave therapy (TUMT) for men with symptomatic BPH with multiple comparison groups. **Results:** 15 studies, 1,585 patients, mean age 66.8 yr, 3-60 mo duration. Mean urinary symptom scores decreased by 65% with TUMT and 77% with TURP. The pooled mean peak urinary flow increased by 70% with TUMT and 119% with TURP. Compared with TURP, TUMT was associated with decreased risks for retrograde ejaculation, treatment for strictures, hematuria, blood transfusions and transurethral resection syndrome, but increased risk for dysuria, urinary retention and retreatment for BPH symptoms.

Conclusions: Overall, microwave thermotherapy techniques are effective alternatives to TURP and α -blockers for treating symptomatic BPH, although less effective than TURP in improving symptom score and urinary flow.

Nerve roots in micturition:

"S2-3-4 keeps the urine off the floor"

"Spinal shock", initially manifests as atonic bladder

- clean intermittent catheterization (CIC)
- treatment options depend on status of bladder and urethra
 - bladder hyperactivity → anticholinergic medications to relax bladder (see *Urinary Incontinence, U5*)
 - ♦ if refractory
 - botulinum toxin injections into bladder wall
 - occasionally augmentation cystoplasty (enlarging bladder volume and improving compliance by grafting section of detubularized bowel onto the bladder)
 - occasionally urinary diversion (ileal conduit or continent diversion) in severe cases if bladder management unsuccessful
 - flaccid bladder → CIC

Dysuria

Definition

- painful urination

Etiology

Table 7. Differential Diagnosis of Dysuria

Infectious	Cystitis, urethritis, prostatitis, epididymitis/orchitis (if associated with lower tract inflammation), cervicitis, vulvovaginitis, perineal inflammation/infection, TB, vestibulitis
Neoplasm	Kidney, bladder, prostate, penis, vagina/vulva, BPH
Calculi	Bladder stone, urethral stone, ureteral stone
Inflammatory	Seronegative arthropathies (reactive arthritis: arthritis, uveitis, urethritis), drug side effects, autoimmune disorders, chronic pelvic pain syndrome (CPPS), interstitial cystitis
Hormonal	Endometriosis, hypoestrogenism
Trauma	Catheter insertion, post-coital cystitis (honeymoon cystitis)
Psychogenic	Somatization disorder, depression, stress/anxiety disorder
Other	Contact sensitivity, foreign body, radiation/chemical cystitis, diverticulum

Investigations

- focused Hx and P/E to determine cause (fever, d/c, conjunctivitis, CVA tenderness, back/joint pain)
 - any d/c (urethral, vaginal, cervical) should be sent for gonococcus/chlamydia testing; wet mount if vaginal d/c
 - U/A and urine C&S
 - if suspect infection, may start empiric ABx treatment (see *Table 9, U12*)
 - ± imaging of urinary tract (tumour, stones)

Hydronephrosis

- the upper urinary tract consists of the kidneys and ureters

Definition

- dilation of the renal pelvis and calyces caused by the impairment in antegrade urine flow

Etiology

- mechanical
 - congenital: see *Congenital Abnormalities, U36*
 - acquired
 - ♦ intrinsic: trauma, inflammation and bleeding, calculi, urologic neoplasms, BPH, urethral stricture, phimosis, previous urological surgery
 - ♦ extrinsic: trauma, neoplasms (uterine fibroid; colorectal, uterine, and cervical malignancies; lymphoma), aortic aneurysm, pregnancy (gravid uterus)
- functional
 - neuropathic: neurogenic bladder, diabetic neuropathy, spinal cord disease
 - pharmacologic: α-adrenergic agonists
 - hormonal: pregnancy (progesterone decreases ureteral tone)

Investigations

- focused Hx, inquiring about pain (flank, lower abdomen, testes, labia), U/O, medication use, pregnancy, trauma, fever, Hx of UTIs, calculi, PID, and urological surgery
- CBC, electrolytes, Cr, BUN, U/A, C&S
- imaging studies (U/S is >90% sensitive and specific)
 - MAG3 diuretic renogram: evaluates differential renal function and demonstrates if functional obstruction exists

Treatment

- hydronephrosis can be physiologic
- treatment should be guided at improving symptoms, treating infections, or improving renal function
- urgent treatment may require percutaneous nephrostomy tube or ureteral stenting to relieve pressure

Post-Obstructive Diuresis

Definition

- polyuria resulting from relief of severe chronic obstruction
- $>3\text{ L}/24\text{ h}$ or $>200\text{ cc/h}$ over each of two consecutive hours

Pathophysiology

- physiologic POD secondary to excretion of retained urea, Na^+ , and H_2O (high osmotic load) after relief of obstruction
 - self-limiting; usually resolves in 48 h with PO fluids but may persist to pathologic POD
- pathologic POD is a Na^+ -wasting nephropathy secondary to impaired concentrating ability of the renal tubules due to:
 - decreased reabsorption of NaCl in the thick ascending limb and urea in the collecting tubule
 - increased medullary blood flow (solute washout)
 - increased flow and solute concentration in the distal nephrons

Management

- admit patient and closely monitor hemodynamic status and electrolytes (Na^+ and K^+ q6-12h and replace prn; follow Cr and BUN to baseline)
- monitor U/O q2h and ensure total fluid intake $< \text{U/O}$ by replacing every 1 mL U/O with 0.5 mL 1/2 NS IV (PO fluids if physiologic POD)
- avoid glucose-containing fluid replacement (iatrogenic diuresis)

Overactive Bladder

Definition

- a symptom complex that includes urinary urgency with or without urgency incontinence, urinary frequency (voiding ≥ 8 times in a 24 hr period), and nocturia (awakening ONE or more times at night to void)

Etiology

- multiple etiologies proposed
- symptoms usually associated with involuntary contractions of the detrusor muscle
- may be associated with other conditions such as SUI in women and BPH in men (see Table 8)
- may be neurogenic, myogenic or idiopathic

Epidemiology

- F:M= 1:1
- prevalence increases with age. 42% in males ≥ 75 years; 31% in females ≥ 75 years

Diagnosis

- the diagnostic process should document symptoms that define overactive bladder and exclude other disorders that could cause of the patient's symptoms
- minimal requirements for the process consist of:
 - focused history including past genitourinary disorders and conditions outlined in Table 8, questionnaires of LUTS for women and diaries of urination frequency, volume and pattern
 - P/E including genitourinary, pelvic and rectal examination
 - U/A to rule out hematuria and infection
- in some patients, the following investigations could be considered
 - post-void residual
 - cystoscopy to rule out recurrent infections, carcinoma in situ and other intravesical abnormalities
 - ♦ urodynamics to rule out obstruction in older men

Treatment

- non-pharmacological: behaviour therapies such as bladder training, bladder control strategies, pelvic floor muscle training, fluid management, and avoidance of caffeine, alcohol
- pharmacological
 - anti-muscarinics: oxybutynin hydrochloride, tolterodine, solifenacin, fesoterodine, or trospium
 - β_3 -adrenoceptor agonist: mirabegron
- refractory patients may be treated with:
 - neuromuscular-junction inhibition: botulinum toxin bladder injection
- others
 - percutaneous tibial nerve stimulation (not used commonly in Canada)
 - sacral neuromodulation

Table 8. Conditions that Could Contribute to Symptoms of Overactive Bladder

Lower Urinary Tract Conditions	UTI, obstruction, impaired bladder contractility
Neurological Conditions	Stroke, MS, dementia, diabetic neuropathy
Systemic Diseases	CHF, sleep disorders (primarily nocturia)
Functional and Behavioural	Excessive caffeine and alcohol, constipation, impaired mobility
Medication	Diuretics, anticholinergic agents, narcotics, calcium-channel blocker, cholinesterase inhibitors

Infectious and Inflammatory Diseases

Table 9. Antibiotic Treatment of Urological Infections

Condition	Drug	Duration
Urethritis	Non-Gonococcal azithromycin (1 g PO)	x 1 d
	OR doxycycline (100 mg PO bid)	7 d
	Gonococcal ceftriaxone (250 mg IM) AND treat for <i>Chlamydia trachomatis</i>	x 1
Simple, Uncomplicated UTI	TMP-SMX (160 mg/800 mg PO bid)	3 d
	OR nitrofurantoin (100 mg PO bid)	5 d
Complicated UTI	ciprofloxacin (1 g PO daily OR 400 mg IV q12h)	up to 2-3 wk
	OR ampicillin (1 g IV q6h) + gentamicin (1 mg/kg IV q8h) (used for relatively short courses because of toxicity)	up to 2-3 wk
	OR ceftriaxone (1-2 g IV q24h)	up to 2-3 wk
Recurrent/Chronic Cystitis	Prophylactic Treatment Continuous: TMP-SMX (40 mg/200 mg PO qHS OR 3x/wk)	6-12 mo
	OR nitrofurantoin (50-100 mg PO qHS)	6-12 mo
	Post-Coital: TMP-SMX (40 mg/200 mg-80 mg/400 mg)	within 2 h of coitus
	OR nitrofurantoin (50-100 mg PO qd)	within 2 h of coitus
Acute Prostatitis	ciprofloxacin (500-750 mg PO bid)	2-4 wk
	OR TMP-SMX (160 mg/800 mg PO bid)	4 wk
	OR IV therapy with gentamicin and ampicillin, penicillin with β -lactamase inhibitor, 3rd gen cephalosporin, OR a fluoroquinolone	4 wk (IV and oral step-down)
Chronic Prostatitis	ciprofloxacin (500 mg PO bid)	4-6 wk
Epididymitis/Orchitis	<35 yr ceftriaxone (200 mg IM)	x 1
	AND doxycycline (100 mg PO bid)	10 d
	\geq 35 yr ofloxacin (300 mg PO bid)	10 d
Acute Uncomplicated Pyelonephritis	ciprofloxacin (500 mg PO bid)	7 d
	\pm ceftriaxone (1 g IV) OR ciprofloxacin (400 mg IV)	x 1
	OR IV therapy with a fluoroquinolone, gentamicin and ampicillin, extended spectrum cephalosporin, extended spectrum penicillin, OR a carbapenem	14 d total (IV and oral step-down)

Antibiotic therapy should always be based on local resistance patterns and adjusted according to culture and sensitivity results

Cystitis: Common Pathogens

KEEPS

Klebsiella sp.
E. coli (90%), other Gram-negatives
Enterococci
Proteus mirabilis, *Pseudomonas*
S. saprophyticus

Acute uncomplicated pyelonephritis: suspected or confirmed *Enterococcus* infection requires treatment with ampicillin

Urinary Tract Infection

- for UTIs during pregnancy, see [Obstetrics, OB28](#)

Definition

- symptoms suggestive of UTI + evidence of pyuria and bacteriuria on U/A or urine C&S
 - if asymptomatic + 100,000 CFU/mL = asymptomatic bacteriuria; only requires treatment in certain patients (e.g. pregnancy)

Classification

- uncomplicated: lower UTI in a setting of functionally and structurally normal urinary tract
- complicated: structural and/or functional abnormality, male patients, immunocompromised, diabetic, iatrogenic complication, pregnancy, pyelonephritis, catheter-associated
- recurrent: see *Recurrent/Chronic Cystitis*

Risk Factors

- stasis and obstruction
 - residual urine due to impaired urine flow e.g. PUVs, reflux, medication, BPH, urethral stricture, cystocele, neurogenic bladder
- foreign body
 - introduce pathogen or act as nidus of infection e.g. catheter, instrumentation
- decreased resistance to organisms
 - DM, malignancy, immunosuppression, spermicide use, estrogen depletion, antimicrobial use
- other factors
 - trauma, anatomic abnormalities, female, sexual activity, menopause, fecal incontinence

Clinical Features

- storage symptoms: frequency, urgency, dysuria
- voiding symptoms: hesitancy, post-void dribbling, dysuria
- other: suprapubic pain, hematuria, foul-smelling urine
- pyelonephritis – if present: typically presents with more severe symptoms (e.g. fever/chills, CVA tenderness, flank pain)

Organisms

- typical organisms: KEEPS (*E. coli* 75-95%)
- atypical organisms
 - tuberculosis (TB)
 - *Chlamydia trachomatis*
 - *Mycoplasma (Ureaplasma urealyticum)*
 - fungi (*Candida*)

Indications for Investigations

- pyelonephritis
- persistence of pyuria/symptoms following adequate antibiotic therapy
- severe infection with an increase in Cr
- recurrent/persistent infections
- atypical pathogens (urea splitting organisms)
- Hx of structural abnormalities/decreased flow

Investigations

- U/A, urine C&S
 - UA: leukocytes ± nitrites ± hematuria
 - C&S: midstream, catheterized, or suprapubic aspirate
- if hematuria present, retest post-treatment, if persistent need hematuria workup (see *Microscopic Hematuria, U5*)
- U/S, CT scan if recurrent or treatment-resistant UTIs, suspected anatomic abnormalities, history indicates complicated cystitis

Treatment

- see Table 9, U12, *Antibiotic Treatment of Urological Infections*
- if febrile, consider admission with IV therapy and rule out obstruction

**Prevention of UTIs**

- Maintain good hydration (try cranberry juice)
- Wipe from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

Recurrent/Chronic Cystitis

Definition

- ≥ 3 UTIs/yr

Etiology

- bacterial reinfection (80%) vs. bacterial persistence (relapse)
 - bacterial reinfection
 - ♦ recurrence of infection with either 1) a different organism, 2) the same organism if cultured >2 wk following therapy, or 3) with any organism with an intermittent sterile culture
 - bacterial persistence
 - ♦ same organism cultured within 2 wk of sensitivity-based therapy

Investigations

- assess predisposing factors
- investigations may include cystoscopy, U/S, CT

Treatment

- lifestyle changes (limit caffeine intake, increase fluid/H₂O intake)
- ABx: continuous vs. post-coital
- post-menopausal women: consider topical or systemic estrogen therapy
- no treatment for asymptomatic bacteriuria except in pregnant women or patients undergoing urinary tract instrumentation

Interstitial Cystitis (Painful Bladder or Bladder Pain Syndrome)

Definition

- bladder pain, chronic urgency and frequency without other reasonable causation

Classification

- non-ulcerative (more common)
- ulcerative

Etiology

- unknown
 - theories: increased epithelial permeability, autoimmune, neurogenic, defective GAG layer overlying mucosa

Epidemiology

- prevalence: 20/100,000
- 90% of cases are in females
- mean age at onset is 40 yr (non-ulcerative tends to affect a younger to middle-aged population, while ulcerative tends to be seen in middle-aged to older)

Clinical Features

- bladder pain, increase with filling and relief with emptying
- glomerulations (submucosal petechiae) or Hunner's lesions (ulcers) on cystoscopic examination
- urinary urgency
- negative U/A, urine C&S, and urine cytology

Differential Diagnosis

- UTI, vaginitis, bladder tumour
- radiation/chemical/eosinophilic/TB cystitis
- eosinophilic/TB cystitis
- bladder calculi

Investigations

- Hx, P/E, urinalysis with microscopy

Treatment

- first-line: patient empowerment (diet, lifestyle, stress management), pain management
- second-line
 - oral: pentosan polysulfate sodium, amitriptyline, cimetidine, hydroxyzine
 - intravesical: dimethylsulfoxide (DMSO), heparin, lidocaine
- third-line: cystoscopy with bladder hydrodistention (traditionally diagnostic) under GA, treat Hunner's lesions if present
- other: neuromodulation, cyclosporine A, intradetrusor botulinum toxin
- surgery (last resort): augmentation cystoplasty, or urinary diversion ± cystectomy

Cystoscopic evaluation is not necessary to make a diagnosis

Four Symptom Scores Exist to Evaluate and Monitor Patients with Interstitial Cystitis

- Interstitial Cystitis Symptom Index (ICSI)
- Interstitial Cystitis Problem Index (ICPI)
- Wisconsin Interstitial Cystitis (UW-IC) Scale
- Pain, Urgency and Frequency (PUF) Score

Acute Pyelonephritis

Definition

- infection of the renal parenchyma with local and systemic manifestations
- clinical diagnosis of flank pain, fever and elevated WBC

Etiology

- ascending (usually GN bacilli) or hematogenous route (usually GP cocci)
- causative microorganisms
 - gram positives: *Enterococcus faecalis*, *S. aureus*, *S. saprophyticus*
 - gram negatives: *E. coli*, *Klebsiella*, *Proteus*, *Pseudomonas*, *Enterobacter*
- common underlying causes of pyelonephritis
 - stones, strictures, prostatic obstruction, vesicoureteric reflux, neurogenic bladder, catheters, DM, sickle-cell disease, PCKD, immunosuppression, post-renal transplant, instrumentation, pregnancy

Clinical Features

- rapid onset (<24 h)
- LUTS including frequency, urgency, hematuria; NOT dysuria unless concurrent cystitis
- fever, chills, nausea, vomiting, myalgia, malaise
- CVA tenderness and/or exquisite flank pain

Investigations

- U/A, urine C&S
- CBC and differential: leukocytosis, left shift
- imaging indicated if suspicious of complicated pyelonephritis or symptoms do not improve with 48-72 h of treatment
 - abdominal/pelvic U/S
 - CT
- nuclear medicine: DMSA scan can be used to help secure the diagnosis
 - a photopenic defect indicates active infection or scar; if normal alternative diagnoses should be considered

Treatment

- hemodynamically stable
 - outpatient oral ABx treatment ± single initial IV dose (see Table 9, U12)
- severe or non-resolving
 - admit, hydrate, and treat with IV ABx (see Table 9, U12)
- emphysematous pyelonephritis
 - most patients receive nephrectomy after IV ABx started and patient stabilized
 - consider temporization with nephrostomy tubes
- renal obstruction
 - admit for emergent stenting or percutaneous nephrostomy tube

Cystoscopic evaluation is not necessary to make a diagnosis. Nitrofurantoin has poor tissue penetration and therefore is not used to treat pyelonephritis (requires post-renal uroconcentration)

Prostatitis/Prostatodynia

Epidemiology

- most common urologic diagnosis in men <50 yr
- prevalence 2-12%

Classification

Table 10. Comparison of the Three Types of Prostatitis

	Category I: Acute Bacterial Prostatitis	Category II: Chronic Bacterial Prostatitis	Category III: Chronic Pelvic Pain Syndrome (CPPS) (Abacterial)
Etiology	Ascending urethral infection with KEEPS: 80% <i>E. coli</i> Often associated with outlet obstruction, recent cystoscopy, prostatic biopsy Most infections occur in the peripheral zone (see Figure 7, U7)	Recurrent exacerbations of acute prostatitis-like signs and symptoms Recurrent UTI with same organism	Divided into inflammatory (IIIA) and non-inflammatory (IIIB) Intraprostatic reflux of urine ± urethral hypertonia Multifactorial (immunological, neuropathic, neuroendocrine, psychosocial)
Clinical Features	Acute onset fever, chills, malaise Rectal, lower back, and perineal pain LUTS	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain
Investigations	P/E: abdomen, external genitalia, perineum, prostate U/A Blood CBC, C&S Transrectal U/S if non-resolving/suspect prostatic abscess	E: as per Category I + pelvic floor Urine C&S: 4-glass test VB1 (voided bladder): initial (urethra) P/VB2: midstream (bladder) EPS (expressed prostatic secretions): not usually performed VB3: post-massage/DRE	Same as per Category II NIH-CPSI score* Consider psychological assessment
Treatment	Supportive measures PO or IV ABx depending how sick (see Table 9, U12) May consider catheterization in patients with severe obstructive LUTS or retention Diagnose and treat if abscess is present	ABx (see Table 9, U12) Consider addition of an β -blocker	Supportive measures Trial of ABx therapy if newly diagnosed Multimodal treatment strategy may include: β -blocker Anti-inflammatories Phytotherapy (quercetin, cernilton)

4-Glass Test: Prostatic source is suggested when colony counts in EPS and VB3 exceed those of VB1 and VB2 by 10x

It is not recommended to do a serum PSA during acute bacterial prostatitis

Prostatic massage may cause extreme tenderness and increased risk of inducing sepsis, abscess, or epididymo-orchitis

*NIH-CPSI: National Institute of Health Chronic Prostatitis Symptom Index

Epididymitis and Orchitis

Etiology

- common infectious causes
 - <35 yr: *N. gonorrhoeae* or *Chlamydia trachomatis*
 - ≥35 yr or penetrative anal intercourse: GI organisms (especially *E. coli*)
- other causes
 - mumps infection may involve orchitis, post-parotitis
 - TB
 - syphilis
 - granulomatous (autoimmune) in elderly men
 - amiodarone (involves only head of epididymis)
 - chemical: reflux of urine into ejaculatory ducts

Risk Factors

- UTI
- unprotected sexual contact
- instrumentation/catheterization
- increased pressure in prostatic urethra (straining, voiding, heavy lifting) may cause reflux of urine along vas deferens → sterile epididymitis
- immunocompromise

Clinical Features

- sudden onset scrotal pain and swelling ± radiation along cord to flank
- scrotal erythema and tenderness
- fever
- storage symptoms, purulent d/c
- reactive hydrocele

Investigations

- U/A, urine C&S
- ± urethral d/c: Gram stain/culture
- if diagnosis uncertain, MUST rule out testicular torsion (U/S Doppler)

Treatment

- rule out torsion (see *Investigations Table 24, U29*)
- see *Table 9, U12* for ABx therapy
- scrotal support, bed rest, ice, analgesia

Complications

- if severe → testicular atrophy
- 30% have persistent infertility problems

Urethritis

Etiology

- infectious or inflammatory (e.g. reactive arthritis)

Table 11. Infectious Urethritis: Gonococcal vs. Non-Gonococcal

	Gonococcal	Non-Gonococcal
Causative Organism	<i>Neisseria gonorrhoeae</i>	Usually <i>Chlamydia trachomatis</i>
Diagnosis	Hx of sexual contact, thick, profuse, yellow-grey purulent d/c, LUTS Gram stain (GN diplococci), urine PCR and/or culture from urethral specimen	Hx of sexual contact, mucoid whitish purulent d/c, ± storage LUTS Gram stain demonstrates >4 PMN/oil immersion field, no evidence of <i>N. gonorrhoeae</i> , urine PCR and/or culture from urethral specimen
Treatment	See <i>Table 9, U12</i>	See <i>Table 9, U12</i>

If unsure between diagnoses of epididymitis and torsion, always go to OR
Remember: torsion >6 h has poor prognosis

Prehn's Sign: pain may be relieved with elevation of testicles in epididymitis but not in testicular torsion (poor sensitivity, especially in children)

Inadequately treated acute epididymitis may lead to chronic epididymitis or epididymo-orchitis

Reactive Arthritis (formerly known as Reiter's syndrome)
Urethritis, uveitis (or conjunctivitis), and arthritis (can't pee, can't see, can't climb a tree)

If culture negative or unresponsive to treatment consider: *Ureaplasma urealyticum*, *Mycoplasma genitalium*, *Trichomonas vaginalis*, HSV, or adenovirus

Stone Disease

Epidemiology

- prevalence: ~8% and increasing
- M:F = 2:1
- peak incidence 30-50 yr of age
- recurrence rate: 10% at 1 yr, 50% at 5 yr, 60-80% lifetime

Risk Factors

- hereditary: RTA, Glucose-6-phosphate dehydrogenase deficiency, cystinuria, xanthinuria, oxaluria, etc.
- lifestyle: minimal fluid intake; excess vitamin C, oxalate, purines, calcium
- medications: loop diuretics (furosemide, bumetanide), acetazolamide, topiramate, zonisamide, indinavir, acyclovir, sulfadiazine, triamterene
- medical conditions: UTI (with urea-splitting organisms: *Proteus*, *Pseudomonas*, *Providencia*, *Klebsiella*, *Mycoplasma*, *Serratia*, *S. aureus*), myeloproliferative disorders, IBD, gout, DM, hypercalcemia disorders (hyperparathyroidism, tumour lysis syndrome, sarcoidosis, histoplasmosis), obesity (BMI >30)

Clinical Features

- urinary obstruction → upstream distention → pain
 - flank pain from renal capsular distention (non-colicky)
 - severe waxing and waning pain radiating from flank to groin, testis, or tip of penis from distended collecting system or ureter (ureteral colic)
- writhing, persistent discomfort, nausea, vomiting, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- bladder stones result in: storage and voiding LUTS, terminal hematuria, suprapubic pain
- if fever, rule out concurrent pyelonephritis and/or obstruction

Table 12. Differential Diagnosis of Renal Colic

GU	Abdominal	Neurological
Pyelonephritis	AAA	Radiculitis (L1): herpes zoster, nerve root compression
Ureteral obstruction from other cause:	Bowel ischemia	
UPJ obstruction, colic secondary to gross hematuria, sloughed papillae	Pancreatitis	
Gynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, PID	Other acute abdominal crisis (appendicitis, cholecystitis, diverticulitis)	

Location of Stones

- calyx: may cause flank discomfort, persistent infection, persistent hematuria, or remain asymptomatic
- pelvis: tend to cause obstruction at UPJ, may cause persistent infection
- ureter: <5 mm diameter will pass spontaneously in 75% of patients

Stone Pathogenesis

- supersaturation of stone constituents (at appropriate temperature and pH)
- stasis, low flow, and low volume of urine (dehydration)
- crystal formation and stone nidus
- loss of inhibitory factors
 - citrate (forms soluble complex with calcium)
 - magnesium (forms soluble complex with oxalate)
 - pyrophosphate
 - Tamm-Horsfall glycoprotein

Key Points in Stone Hx

- Diet (especially FLUID INTAKE)
- Predisposing medical conditions
- Predisposing medications
- Previous episodes/investigations/treatments
- Family Hx (1st degree relative)

The four narrowest passage points for upper tract stones are:

- UPJ
- Pelvic brim
- Under vas deferens/broad ligament
- UVJ

	Radiopaque	Radiolucent
KUB	Calcium	Uric acid
	Struvite	Indinavir
	Cystine	Atazanavir
CT	Calcium	Indinavir
	Struvite	Atazanavir
	Cystine	
	Uric acid	

Approach to Renal Stones

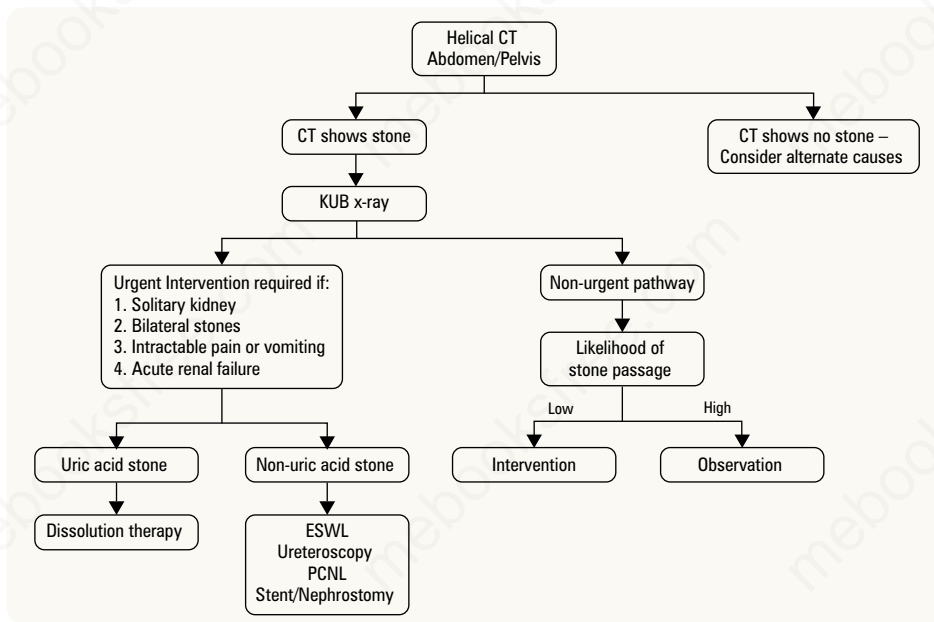

Figure 8. Approach to renal stone

Although hypercalcaemia is a risk factor for stone formation, decreasing dietary calcium is NOT recommended to prevent stone formation. Low dietary calcium leads to increased GI oxalate absorption and higher urine levels of calcium oxalate

Stones and Infection
If septic, urgent decompression via ureteric stent or percutaneous nephrostomy is indicated. Definitive treatment of the stone should be delayed until the sepsis has cleared

Indications for PCNL

- Size > 2 cm
- Staghorn
- UPJ obstruction with correction of obstruction
- Calyceal diverticulum
- Cystine stones (poorly fragmented with ESWL)
- Anatomical abnormalities
- Failure of less invasive modalities

Investigations

Table 13. Investigations for Renal Stones

	CBC, Uric Acid, U/A, Urine C&S	KUB x-ray	CT Scan	Abdominal Ultrasound	Cystoscopy	PTH, 24 h urine x 2 for volume, Cr, Ca ²⁺ , Na ⁺ , PO ₄ ³⁻ , Mg ²⁺ , oxalate, citrate, ± cystine
Who gets it?	Everyone	Most	First episode renal colic	Pediatric cases or those concerning for obstruction	± Those concerning for bladder stone	Recurrent Ca ²⁺ stone formers ± pediatric cases
Why is it done?	May show signs of infection, ± sensitivities	90% of stones are radiopaque Good for follow-up	Distinguish radiolucent stone from soft tissue filling defect X-ray comparison	Identify and follow-up stone without radiation exposure Visualize hydronephrosis	Visualize bladder	Need to rule out metabolic cause for stones
Cautions	—	Do not mistake phleboliths for stones!	Radiation (especially if female of child bearing age) Must be a non-contrast scan	—	—	—

Treatment – Acute

- medical
 - analgesic ± antiemetic
 - NSAIDs help lower intra-ureteral pressure
 - medical expulsion therapy (MET)
 - ♦ α-blockers: increase rate of spontaneous passage in distal ureteral stones
 - ± Abx for bacteriuria
 - IV fluids if vomiting (note: IV fluids do NOT promote stone passage)
- interventional
 - required if obstruction endangers patient, e.g. sepsis, renal failure
 - first line: ureteric stent (via cystoscopy)
 - second line: image-guided percutaneous nephrostomy
- admit if necessary
 - see *Indications for Admission to Hospital*

24 h urine collections must be done AFTER discontinuing stone preventing/promoting medications

Indications for Admission to Hospital

- Intractable pain
- Intractable vomiting
- Fever (suggests infection)
- Compromised renal function (including single kidney, bilateral obstructing stone)
- Pregnancy

Treatment – Elective

- medical
 - likely conservative if ureteral stone <10 mm or kidney stone <5 mm and no complications/symptoms well controlled
 - ♦ stones <5 mm especially likely to pass spontaneously
 - PO fluids to increase urine volume to >2 L/d (3-4 L if cystine) and MET
 - specific to stone type (see Table 14)
 - periodic imaging to monitor stone position and assess for hydronephrosis
 - progress to interventional stone removal methods if symptoms worsen or fail to improve (indicating stone passage)

Detailed metabolic studies are NOT recommended unless complex patient (recurrent stone formers, pregnancy, pediatrics, strong family Hx, underlying kidney or systemic disease, etc.)

- interventional
 - kidney
 - ♦ may stent prior to ESWL if stone is 1.5-2.5 cm
 - ♦ ESWL if stone <2 cm
 - ♦ PCNL if stone >2 cm
 - ureteral stones >10 mm
 - ♦ ESWL and URS are both first line treatment modalities for all locations
 - URS has significantly greater stone-free rates for stones at all locations in ureter, but also has higher complication rates (ureter perforation, stricture formation, etc.)
 - ♦ PCNL is second line treatment
 - ♦ laparoscopic or open stone removal (very rare)
 - bladder
 - ♦ transurethral stone removal or cystolitholapaxy
 - ♦ remove outflow obstruction (TURP or stricture dilatation)

Prevention

- dietary modification
 - increase fluid (>2 L/d), K⁺ intake
 - reduce animal protein, oxalate, Na⁺, sucrose, and fructose intake
 - avoid high-dose vitamin C supplements
- medications
 - thiazide diuretics for hypercalciuria
 - allopurinol for hyperuricosuria
 - potassium citrate for hypocitraturia, hyperuricosuria

Alpha-blockers as Medical Expulsive Therapy for Ureteral Stones

Cochrane DB Syst Rev 2014;4:CD008509
Purpose: To determine whether or not α-blockers compared with other pharmacological treatments or placebo improve stone clearance rates and other clinically relevant outcomes in patients presenting with symptoms of stones less than 10 mm confirmed by imaging.
Results/Conclusions: 32 RCTs, 5,864 participants. Although patients using α-blockers were more likely to experience adverse effects compared to standard therapy, stone-free rates were significantly higher in the α-blocker group (RR 1.48, 95% CI 1.33-1.64), expulsion time was 2.91 days shorter, and there was a reduction in the number of pain episodes (MD -0.48, 95% CI -0.94 to -0.01), the need for analgesic medication (MD -38.17, 95% CI -74.93 to -1.41), and hospitalization (RR 0.35, 95% CI 0.13-0.97). α-blockers should therefore be offered as a primary treatment modality for ureteral stones.

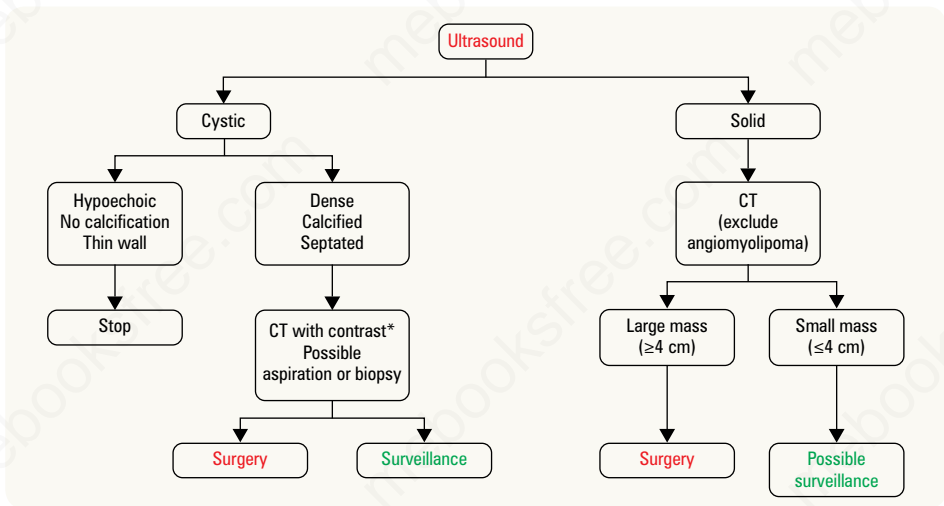

Consideration must be given to monitoring stone formers with periodic imaging (i.e. at year 1 and then q2-4yr based on likelihood of recurrence)

Table 14. Stone Classification

Type of Stone	Calcium (75-85%)	Uric Acid (5-10%)	Struvite (5-10%)	Cystine (1%)
Etiology	Hypercalciuria Hyperuricosuria (25% of patients with Ca ²⁺ stones) Hyperoxaluria (<5% of patients) Hypocitraturia (12% of patients) Other causes: Hypomagnesemia – associated with hyperoxaluria and hypocitraturia High dietary Na ⁺ Decreased urinary proteins High urinary pH, low urine volume (e.g. GI water loss) Hyperparathyroidism, obesity, gout, DM	Uric acid precipitates in low volume, acidic urine with a high uric acid concentration: Hyperuricosuria alone Drugs (ASA, thiazides) Diet (purine rich red meats) Hyperuricosuria with hyperuricemia Gout High rate of cell turnover or cell death (leukemia, cytotoxic drugs)	Infection with urea-splitting organisms (<i>Proteus</i> , <i>Pseudomonas</i> , <i>Providencia</i> , <i>Klebsiella</i> , <i>Mycoplasma</i> , <i>Serratia</i> , <i>S. aureus</i>) results in alkaline urinary pH and precipitation of struvite (magnesium ammonium phosphate)	Autosomal recessive defect in small bowel mucosal absorption and renal tubular absorption of dibasic amino acids results in "COLA" in urine (cystine, ornithine, lysine, arginine)
Key Features	Radiopaque on KUB Reducing dietary Ca ²⁺ is NOT an effective method of prevention/treatment	Radiolucent on KUB Radiopaque on CT Acidic urine, pH <5.5 (NOT necessarily elevated urinary uric acid)	Perpetuates UTI because stone itself harbours organism Stone and all foreign bodies must be cleared to avoid recurrence Associated with staghorn calculi Positive urine dip and cultures Note: <i>E. coli</i> infection does not cause struvite stones M:F = 3:1, UTI more common in female	Aggressive stone disease seen in children and young adults Recurrent stone formation, family Hx Often staghorn calculi Faintly radiopaque on KUB Positive urine sodium nitroprusside test, urine chromatography for cystine
Treatment	Fluids to increase urine volume to >2 L/d For calcium stones: cellulose phosphate, orthophosphate for absorptive causes Calcium oxalate: thiazides, ± potassium citrate, ± allopurinol Calcium struvite: ABx (stone must be removed to treat infection)	Increased fluid intake Alkalinization of urine to pH 6.5 to 7 (bicarbonate, potassium citrate) ± allopurinol	Complete stone clearance ABx for 6 wk Regular follow-up urine cultures	Increased fluid intake (3-4 L of urine/d) Alkalinize urine (bicarbonate, potassium citrate), Penicillamine/α-MPG or Captopril (form complex with cystine) ESWL not effective

Urological Neoplasms

Approach to Renal Mass

There is controversy over optimal management of small renal masses

Percutaneous needle biopsies of cystic renal masses may lead to peritoneal seeding

Tuberous Sclerosis

- Syndrome characterized by mental retardation, epilepsy, and adenoma sebaceum
- 45-80% of patients also present with angiomyolipomas which are often multiple and bilateral

Figure 9. Workup of a renal mass

*Imaging modality may be different in cases of contrast allergy or elevated creatinine

Benign Renal Neoplasms

CYSTIC KIDNEY DISEASE

- simple cysts: usually solitary or unilateral
 - very common: up to 50% at age 50
 - usually incidental finding on abdominal imaging
 - Bosniak Classification is used to stratify for risk of malignancy based on cyst features from contrast CT
- polycystic kidney disease
 - autosomal recessive: multiple bilateral cysts, often leading to early renal failure in infants
 - autosomal dominant: progressive bilateral disease leading to HTN and renal failure, adult-onset
- medullary sponge kidney: cystic dilatation of the collecting ducts
 - usually benign course, but patients are predisposed to stone disease
- von Hippel-Lindau syndrome: multiple bilateral cysts or clear cell carcinomas (50% incidence of RCC)
 - renal cysts, cerebellar, spinal and retinal hemangioblastomas, pancreatic and epididymal cysts, pheochromocytomas

Table 15. Bosniak Classification of Renal Cysts

Class	Description	Features	Risk of Malignancy	Management Plan
I	Simple cyst	Round, no septations, no calcifications, no solid component	Near zero	Follow-up usually not required
II	Simple cyst	A few thin septa, no true enhancement, well-margined, uniform high attenuation, <3 cm	Minimal	Follow-up usually not required
IIF	Minimally complex cyst with extra features that require follow-up	Still well-margined and non-enhancing, but now multiple thin septa or some thickening/calcification of septa/wall, >3 cm	5-20%	Requires follow-up with imaging q6-12mo If the lesion evolves, may require surgical resection
III	Complex cyst	Thicker or more irregular walls with measurable enhancement	>50%	Requires surgical resection
IV	Clearly malignant	Class III + enhancing soft-tissue components	>90%	Requires surgical resection

Table 16. Benign Renal Masses

	Angiomyolipoma (Renal Hamartoma)	Renal Oncocytoma	Renal Adenoma
Epidemiology	<1% of adult renal tumours F>M 20% associated with tuberous sclerosis (especially if multiple, recurrent)	3-7% of renal tumours M>F Oncocytomas also found in adrenal, thyroid and parathyroid glands	Most common benign renal neoplasm M:F = 3:1 Incidence increases with age Found in 7-23% of all autopsies
Characteristics	Clonal neoplasm consisting of blood vessels (angio-), smooth muscle (-myo-), and fat (-lipoma) May extend into regional lymphatics and other organs and become symptomatic	Spherical, capsulated with possible central scar Histologically organized aggregates of eosinophilic cells originating from intercalated cells of collecting duct	Small cortical lesions <1 cm Majority are solitary but can be multifocal
Diagnosis	Incidental finding on CT Negative attenuation (-20 HU) on CT is pathognomonic Rare presentation of hematuria, flank pain, and palpable mass (same as RCC)	Incidental finding on CT Difficult to distinguish from RCC on imaging – treated as RCC until proven otherwise Biopsy may be performed to rule out malignancy	Incidental finding on CT Rarely symptomatic Controversy as to whether this represents benign or pre-malignant neoplasm
Management	May consider surgical excision or embolization if symptomatic (pain, bleeding) or higher risk of bleeding (e.g. pregnancy) Potential role for mTOR inhibitors in unresectable/metastatic disease Follow with serial U/S	Partial/radical nephrectomy for large masses HIFU or RFA for smaller masses	If mass >3 cm, likely not a benign adenoma; will require partial/radical nephrectomy due to increased likelihood of malignancy

Malignant Renal Neoplasms

RENAL CELL CARCINOMA

Etiology

- cause unknown
- originates from proximal convoluted tubule epithelial cells in clear cell subtype (most common)
- hereditary forms seen with von Hippel-Lindau syndrome and hereditary papillary renal carcinoma

Epidemiology

- 85% of primary malignant tumours in kidney
- M:F = 1.5:1
- peak incidence at 50-60 yr of age

Pathology

- histological subtypes: clear cell (75-85%), papillary (10-15%), chromophobic (5-10%), collecting duct
- sarcomatoid elements in any subtype is a marker of poor prognosis

Risk Factors

- top 3 risk factors: smoking, HTN, obesity
- miscellaneous: horseshoe kidney, acquired renal cystic disease
- role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

Clinical Features

- usually asymptomatic: frequently diagnosed incidentally by U/S or CT
- indicators for poor prognosis: weight loss, weakness, anemia, bone pain
- classic “too late triad” found in 10-15%
 - gross hematuria 50%
 - flank pain <50%
 - palpable mass <30%
- metastases: seen in a 1/3 of new cases; additional 20-40% will go on to develop metastases (mostly in late presentations or large tumours)
 - bone, brain, lung and liver most common site
 - may invade renal veins and IVC lumen. This may result in ascites, hepatic dysfunction, right atrial tumour, and pulmonary emboli

Investigations

- routine labs for paraneoplastic syndromes (CBC, ESR, LFTs, extended electrolytes)
- U/A
- renal U/S: solid vs. cystic lesion
- contrast-enhanced CT: higher sensitivity than U/S for detection of renal masses and for staging purposes
- MRI: useful for evaluation of vascular extension
- renal biopsy: to confirm diagnosis if considering observation or other non-surgical therapy

Staging

- involves CT, CXR, liver enzymes and LFTs, bone/head imaging (if symptoms dictate)

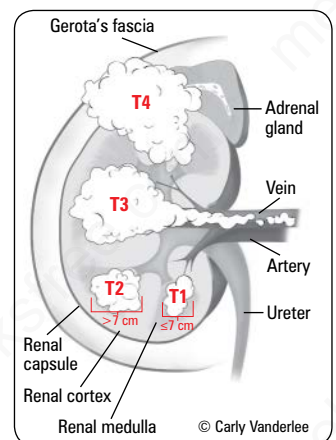

Figure 10. RCC staging

Role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

RCC Systemic Effects: paraneoplastic syndromes (10-40% of patients)

- Hematopoietic disturbances: anemia, polycythemia, raised ESR
- Endocrinopathies: hypercalcemia (increased vitamin D hydroxylation), erythrocytosis (increased erythropoietin), HTN (increased renin), production of other hormones (prolactin, gonadotropins, TSH, insulin, and cortisol)
- Hepatic cell dysfunction or Stauffer syndrome: abnormal LFTs, decreased WBC count, fever, areas of hepatic necrosis; no evidence of metastases; reversible following removal of primary tumour
- Hemodynamic alterations: systolic HTN (due to AV shunting), peripheral edema (due to caval obstruction)

Tumour may invade renal veins and inferior vena cava lumen. This may result in ascites, hepatic dysfunction, right atrial tumour, and pulmonary emboli

Table 17. 2010 TNM Classification of Renal Cell Carcinoma

T	N	M
T1: tumour <7 cm, confined to renal parenchyma T1a: <4 cm T1b: 4-7 cm	N0: no regional lymph node metastasis N1: metastasis in regional lymph nodes	M0: no evidence of metastasis M1: presence of distant metastasis
T2: tumour >7 cm, confined to renal parenchyma T2a: 7-10 cm T2b: >10cm		
T3: tumour extends into major veins or perinephric tissues, but NOT into ipsilateral adrenal or beyond Gerota's fascia T3a: into renal vein or sinus fat T3b: into infradiaphragmatic IVC T3c: into supradiaphragmatic IVC		
T4: tumour extends beyond Gerota's fascia including extension into ipsilateral adrenal		

Treatment

- surgical
 - radical nephrectomy: en bloc removal of kidney, tumour, ipsilateral adrenal gland (in upper pole tumours) and intact Gerota's capsule and paraaortic lymphadenectomy
 - partial nephrectomy (parenchyma-sparing): small tumour (roughly <4 cm) or solitary kidney/bilateral tumours
 - surgical removal of solitary metastasis may be considered
- ablative techniques (cryoablation, RFA)
- palliative radiation to painful bony lesions
- therapy for advanced stage
 - tyrosine kinase inhibitors for metastatic disease (e.g. sunitinib, sorafenib)
 - anti-angiogenesis/anti-VEGF (e.g. bevacizumab)
 - mTOR inhibitors (e.g. temsirolimus, everolimus)
 - high-dose IL-2 (high toxicity but able to induce long-term cure in 5-7% of patients)
 - IFN- α : monotherapy has been largely replaced by molecularly targeted agents listed above

Prognosis

- stage at diagnosis most important prognostic factor
 - T1: 90-100% 5 yr survival
 - T2-T3: 60% 5 yr survival
 - metastatic disease: <5% 10 yr survival

Carcinoma of the Renal Pelvis and Ureter**Etiology**

- risk factors include:
 - smoking
 - chemicals/dietary exposures (industrial dyes and solvents; aristolochic acid, aniline dyes)
 - analgesic abuse (acetaminophen, ASA, and phenacetin)
 - Balkan nephropathy

Epidemiology

- rare: accounts for 5% of all urothelial cancers
- frequently multifocal, 2-5% are bilateral
- M:F = 3:1
- relative incidence: bladder:renal:ureter = 100:10:1

Pathology

- 85% are papillary urothelial carcinoma; others include SCC and adenocarcinoma
- UCC of ureter and renal pelvis are histologically similar to bladder UCC

Clinical Features

- gross/microscopic hematuria
- flank pain
- storage or voiding symptoms (dysuria only if lower urinary tract involved)
- flank mass \pm hydronephrosis (10-20%)

**Carcinoma: Final Efficacy of Safety Results of the Phase III Treatment Approaches in Renal Cancer Global Evaluation Trial**

J Clin Oncol 2009; 27(20):3312-8.
Purpose: Phase III trial of renal cell carcinoma patients who were randomized to receive either sorafenib (n=451) or placebo (n=452).
Results: The overall survival was 17.8 months in the treatment group, compared to 15.2 months in the control group (HR = .88, p = .146). Following adjustment for crossover patients (from placebo to treatment), a significant difference was found in the overall survival (17.8 vs. 14.3 months, HR = .78, p = .029). No difference was found in adverse events at 16 months.

**Axitinib vs. Sorafenib as Second-Line Treatment for Advanced Renal Cell Carcinoma: Overall Survival Analysis and Updated Results from a Randomized Phase 3 Trial**

Lancet Oncol 2013;14:552-562
Study: Phase 3 trial of patients with clear cell metastatic renal cell carcinoma randomized to receive axitinib 5 mg twice daily (n=361) or sorafenib 400 mg twice daily (n=362).
Results: Median overall survival was 20.1 mo with axitinib (16.7-23.4) and 19.2 mo with sorafenib (17.5-22.3) (HR 0.969, 95% CI 0.800-1.174). Median progression-free survival was 8.3 mo with axitinib (6.7-9.2) and 5.7 mo with sorafenib (4.7-6.5) (HR 0.656, 95% CI 0.552-0.779).
Conclusions: Axitinib should be a second-line treatment option for patients with metastatic renal cell carcinoma.

**Radiotherapy With or Without Chemotherapy in Muscle-Invasive Bladder Cancer**

NEJM 2012;366:1477-1488
Study: Phase 3 trial with random assignment of 360 patients with muscle-invasive bladder cancer to radiotherapy with or without chemotherapy.
Results: At 2 yr, rates of locoregional disease-free survival were 67% in the chemoradiotherapy group and 54% in the radiotherapy group (HR 0.68, 95% CI 0.48-0.96). Five year overall survival rates were 48% in the chemoradiotherapy group and 35% in the radiotherapy group (HR 0.82, 95% CI 0.63-1.09).
Conclusions: Chemotherapy with fluorouracil and mitomycin C in combination with radiotherapy improves locoregional control of bladder cancer compared to radiotherapy alone, with no significant increase in adverse events.

**Differential Diagnosis of Filling Defect**

- Urothelial carcinoma (differentiate via cytology and CT scan)
- Uric acid stone (differentiate via cytology and CT scan)
- Blood clot
- Pyelitis cystica
- Papillary necrosis
- Fungus ball
- Gas bubble from gas producing organisms

Investigations

- IVP/CT urogram
- cystoscopy and retrograde pyelogram

Treatment

- radical nephroureterectomy with excision of ipsilateral bladder cuff
- distal ureterectomy for distal ureteral tumours with concomitant ureteral reimplant
- emerging role for endoscopic laser ablation in patients with low grade disease, poor baseline renal health

Bladder Carcinoma

Etiology

- unknown, but environmental risk factors include:
 - smoking (main factor – implicated in 60% of new cases)
 - aromatic amines: naphthylamines, benzidine, tryptophan, phenacetin metabolites
 - cyclophosphamide
 - prior Hx of radiation treatment to the pelvis
 - *Schistosoma hematobium* infection (associated with SCC)
 - chronic irritation: cystitis, chronic catheterization, bladder stones (associated with SCC)
 - aristolochic acid: associated with Balkan Nephropathy (renal failure, upper tract urothelial cancer) and Chinese Herbal Nephropathy

Epidemiology

- 2nd most common urological malignancy
- M:F = 3:1, more common among whites than blacks
- mean age at diagnosis is 65 yr

Pathology

- classification
 - urothelial carcinoma (UC) >90%
 - SCC 5-7%
 - adenocarcinoma 1%
 - others <1%
- stages and prognoses of urothelial carcinoma at diagnosis
 - non-muscle invasive (75%) → >80% overall survival
 - ♦ 15% of these will progress to invasive UC
 - ♦ majority of these patients will have recurrence
 - invasive (25%) → 50-60% 5 yr survival
 - ♦ 85% have no prior history of superficial UC (i.e. *de novo*)
 - ♦ 50% have occult metastases at diagnosis, and most of these will develop overt clinical evidence of metastases within 1 yr – lymph nodes, lung, peritoneum, liver
- carcinoma *in situ* → flat, non-papillary erythematous lesion characterized by dysplasia confined to urothelium
 - more aggressive, worse prognosis
 - usually multifocal
 - may progress to invasive UCC

Clinical Features

- asymptomatic (20%)
- hematuria (key symptom: 85-90% at the time of diagnosis)
- pain (50%) → location determined by size/extent of tumour (i.e. flank, suprapubic, perineal, abdominal, etc.)
- clot retention (17%)
- storage urinary symptoms → consider carcinoma *in situ*
- palpable mass on bimanual exam → likely muscle invasion
- obstruction of ureters → hydronephrosis and uremia (nausea, vomiting, and diarrhea)

Investigations

- U/A, urine C&S, urine cytology
- U/S
- CT scan with contrast → look for filling defect
- cystoscopy with biopsy (gold standard) → establish diagnosis and to determine depth of penetration
- specific bladder tumour markers (e.g. NMP-22, BTA, Immunocyt, FDP)

Grading

- low grade: ≤10% invasive, 60% recur locally
- high grade: 50-80% are invasive or are expected to progress to invasive over time

Staging

- for invasive disease: CT or MRI, CXR, LFTs, extended electrolytes (Ca²⁺, Mg²⁺, PO₄³⁻) (metastatic workup)

The "field defect" theory helps to explain why UCC has multiple lesions and has a high recurrence rate. The entire urothelium (pelvis to bladder) is bathed in carcinogens

The ENTIRE urinary tract must be evaluated in patients with hematuria unless there is clear evidence of glomerular bleeding (e.g. red cell casts, dysmorphic RBCs, etc.)

Cystoscopy is the initial procedure of choice for the diagnosis and staging of urothelial malignancy

Unexplained hematuria in any individual >40 yr old must be investigated to rule out a malignancy

Tumour grade is the single most important prognostic factor for progression

Non-Muscle-Invasive Bladder Cancer (NMIBC) and BCG

AHRQ Publication 2015:15-EHC017-EF #153

Summary: BCG is the only intravesical therapy associated with decreased risk of bladder cancer progression; however, it is also associated with high rate of adverse events. More research is needed to define optimal dose/regimen.

Methods: Review of Ovid Medline, Cochrane Central Register of Controlled Trials, Cochrane Database of SR, Health Technology Assessment, National Health Sciences Economic Evaluation, Database of Abstract of Review of Effects for studies on NMIBC interventions, including intravesical therapy.

Results: BCG is superior in prevention of bladder cancer recurrence compared to no intravesical therapy. BCG is superior to doxorubicin, epirubicin, and mitomycin in prevention of bladder cancer recurrence.

Table 18. 2010 TNM Classification of Bladder Carcinoma

T	N	M
TX: Primary tumour cannot be assessed	NX: Lymph nodes cannot be assessed	M0: No distant metastasis
T0: No evidence of primary tumour	N0: No lymph node metastasis	M1: Distant metastasis
Ta: Noninvasive papillary carcinoma		
Tis: Carcinoma <i>in situ</i> : "flat tumour"		
T1: Tumour invades subepithelial connective tissue	N1: Single regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node)	
T2: Tumour invades muscularis propria	N2: Multiple regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node metastasis)	
pT2a: Tumour invades superficial muscularis propria (inner half)		
pT2b: Tumour invades deep muscularis propria (outer half)		
T3: Tumour invades perivesical tissue	N3: Lymph node metastasis to the common iliac lymph nodes	
pT3a: Microscopically		
pT3b: Macroscopically (extravesical mass)		
T4: Tumour invades any of the following: prostatic stroma, seminal vesicles, uterus, vagina, pelvic wall, abdominal wall		
T4a: Tumour invades prostatic stroma, uterus, vagina		
T4b: Tumour invades pelvic wall, abdominal wall		

Neoadjuvant Chemotherapy plus Cystectomy Compared with Cystectomy Alone for Locally Advanced Bladder Cancer

NEJM 2003;349:859-866
Study: Randomized clinical trial.
Patients: 317 patients with transitional-cell carcinoma of the bladder (T2N0M0 to T4aN0M0).
Intervention: Randomized to undergo radical cystectomy or to receive three cycles of combined chemotherapy (methotrexate, vinblastine, doxorubicin, and cisplatin) followed by radical cystectomy.
Main Outcome: Survival. Secondary objective was to quantify down-staging of tumour following chemotherapy.
Results: At 5 yr after treatment initiation, 57% of the combination-therapy group vs. 43% of the cystectomy group were alive ($p=0.06$). In the combination-therapy group, 38% of the patients were pathologically free of cancer at the time of cystectomy vs. 15% of the cystectomy-only group at the time of surgery ($p<0.001$).
Conclusions: For locally advanced bladder carcinoma, neoadjuvant chemotherapy significantly reduces tumour volume and also improves survival.

Figure 11. Urothelial carcinoma of bladder

Treatment

- superficial (non-muscle invasive) disease: Tis, Ta, T1
 - low-grade disease
 - ♦ TURBT ± intravesical chemotherapy (mitomycin C) to decrease recurrence rate
 - ♦ follow-up with cystoscopy and cytology
 - multifocal, or recurrent
 - ♦ TURBT ± intravesical chemo/immuno-therapy (e.g. BCG, mitomycin C) to decrease recurrence rate
 - T1 or CIS
 - ♦ repeat TURBT in 2-6 wk
 - ♦ maintenance with intravesical chemotherapy with BCG for 3 cycles every 3 mo, may be continued for 2-3 yr
- invasive disease: T2a, T2b, T3
 - radical cystectomy + pelvic lymphadenectomy with urinary diversion (e.g. ileal conduit, Indiana pouch, ileal neobladder) or TURBT + chemo-radiation (bladder sparing) for small tumours with non-obstructed ureters
 - neo-adjuvant chemotherapy prior to cystectomy may also be done
 - use of adjuvant chemotherapy after definitive local treatment is controversial
- advanced/metastatic disease: T4a, T4b, N+, M+
 - initial combination of systemic chemotherapy ± irradiation ± surgery

Prognosis

- depends on stage, grade, size, number of lesions, recurrence and presence of CIS
 - T1: 90% 5 yr survival
 - T2: 55% 5 yr survival
 - T3: 30% 5 yr survival
 - T4/N+/M+: <5% 5 yr survival

Figure 12. Ileal conduit, Indiana pouch, ileal neobladder

Prostate Cancer

Etiology

- not known
- risk factors
 - age >50 yr, risk increases 1% per year after 65 yr
 - increased incidence in persons of African descent
 - high dietary fat (2x)
 - family Hx
 - ◆ 1st degree relative (2x)
 - ◆ 1st and 2nd degree relatives (9x)
 - positive BRCA mutation

Epidemiology

- most prevalent cancer in males
- 3rd leading cause of male cancer deaths (following lung and colon)
- up to 50% risk of CaP at age 50
- lifetime risk of death from CaP is 3%
- 75% diagnosed between ages of 60 and 85; mean age at diagnosis is 65

Pathology

- adenocarcinoma
 - >95%, often multifocal
- urothelial carcinoma of the prostate (4.5%)
 - associated with UC of bladder; does NOT follow TNM staging below; not hormone-responsive
- endometrial (rare)
 - carcinoma of the utricule

Anatomy (see Figure 7, U7)

- 60-70% of nodules arise in the peripheral zone
- 10-20% arise in the transition zone
- 5-10% arise in the central zone

Clinical Features

- usually asymptomatic
- most commonly detected by DRE, elevated PSA, or as an incidental finding on TURP
 - DRE: hard irregular nodule or diffuse dense induration involving one or both lobes
 - PSA: see *Prostate Cancer Screening, U26*
- locally advanced disease
 - storage and voiding symptoms, ED (all uncommon without spread)
- metastatic disease
 - bony metastases to axial skeleton common
 - visceral metastases are less common (liver, lung, and adrenal gland most common sites)
 - leg pain and edema with nodal metastases obstructing lymphatic and venous drainage

Methods of Spread

- local invasion
- lymphatic spread to regional nodes
 - obturator > iliac > presacral/para-aortic
- hematogenous dissemination occurs early

Investigations

- DRE
- PSA elevated in the majority of patients with CaP
- TRUS-guided needle biopsy
- bone scan may be omitted in untreated CaP with PSA <10 ng/mL
- CT scanning to assess metastases
- MRI: being investigated for possible role in detection, staging, MRI-guided biopsy and active surveillance

Table 19. 2010 TNM Classification of Prostate Carcinoma

T	N	M
T1: clinically undetectable tumour, normal DRE and TRUS T1a: tumour incidental histologic finding in <5% of tissue resected T1b: tumour incidental histologic finding in >5% of tissue resected T1c: tumour identified by needle biopsy (due to elevated PSA level)	NX: regional lymph nodes were not assessed N0: no regional lymph node metastasis	M0: no distant metastasis M: distant metastasis M1a: nonregional lymph nodes M1b: bone(s) M1c: other site(s) with or without bone disease
T2: palpable, confined to prostate T2a: tumour involving ≤ one half of one lobe T2b: tumour involving > one half of one lobe, but not both lobes T2c: tumour involving both lobes	N1: spread to regional lymph nodes	
T3: tumour extends through prostate capsule T3a: extracapsular extension (unilateral or bilateral) T3b: tumour invading seminal vesicle(s)		
T4: tumour invades adjacent structures (besides seminal vesicles)		

Table 20. Prostate Cancer Mortality Risk

	Low Risk (if any of following)	Intermediate Risk (if any of following)	High Risk (if any of following)
PSA	<10	10-20	>20
Gleason Score	<7	7	8-10
Stage	pT1-2a	pT2b-T2c	pT3/4

Treatment

- T1/T2 (localized, low-risk)
 - if adequate life expectancy or no other significant comorbidities, consider active surveillance vs. definitive local treatment (RP, brachytherapy, or EBRT)
 - active surveillance for low risk, small volume Gleason 6 prostate cancer
 - no difference in cure or recurrence rates between definitive treatment modalities
 - in older population: watchful waiting + palliative treatment for symptomatic progression
- T1/T2 (intermediate or high-risk)
 - definitive therapy over active surveillance
- T3, T4
 - EBRT + androgen deprivation therapy or RP + adjuvant EBRT
- N >0 or M >0
 - requires hormonal therapy/palliative radiotherapy for metastases; may consider combined androgen blockade
 - bilateral orchiectomy – decreases testosterone production by 90%
 - GnRH agonists (e.g. leuprolide, goserelin)
 - GnRH antagonist (e.g. degarelix)
 - estrogens (e.g. diethylstilbestrol [DES])
 - antiandrogens (e.g. bicalutamide, enzalutamide)
 - local irradiation of painful secondaries or half-body irradiation
- hormone-refractory prostate cancer
 - chemotherapy: docetaxel, cabazitaxel, sipuleucel-T

Table 21. Treatment Options for Localized Prostate Cancer

Modality	Population Considered	Limitations
Watchful Waiting	Short life expectancy (<5-10 yr); will likely only receive non-curative hormonal therapy if disease progresses	Disease progression
Active Surveillance (serial PSA, DRE, and biopsies)	Low grade disease, good follow-up; is still considering more curative treatment if disease progresses	Disease progression; decrease in QOL associated with serial testing; risks associated with biopsies; no optimal monitoring schedule has been defined to date
Brachytherapy	Low volume, low PSA (<10), low grade	ED (50%), long-term effectiveness not well-established
EBRT	Locally advanced disease, older patients	Radiation proctitis (5%), ED (50%), risk of rectal cancer
RP	Young patients (<75 yr), high-risk disease	Incontinence (10%), ED (30-50%)

*Other options include cryosurgery, HIFU, hormonal ablation

Prognosis

- T1-T2: comparable to normal life expectancy
- T3-T4: 40-70% 10 yr survival
- N+ and/or M+: 4 % 5 yr survival
- prognostic factors: tumour stage, tumour grade, PSA value, PSA doubling time

Prostate Cancer Screening

Digital Rectal Exam

- should be included as part of initial screening
- suspicious findings: abnormal feeling, nodularity, focal lesion, discrete change in texture/fullness/symmetry

Prostate Specific Antigen

- glycoprotein produced by epithelial cells of prostate gland
- leaks into circulation in setting of disrupted glandular architecture
- value of <4 ng/mL traditionally considered as cut-off to differentiate normal from pathologic value, but no single justifiable cutpoint
- measured serum PSA is a combination of free (15%) and bound PSA (85%)
- PSA velocity, PSA density, and free:total PSA: all intended to increase sensitivity and specificity of serum PSA values
 - decreased free:total PSA, elevated PSA velocity and elevated PSA density associated with increased CaP rates

Screening Recommendations

- conflicting evidence regarding mortality reduction with PSA-based screening and debate regarding overdiagnosis/overtreatment

10 Year Outcomes After Monitoring, Surgery, or Radiotherapy for Localized Prostates Cancer
NEJM. 2016;375(15):1415-1424

Summary: At 10 years, prostate-cancer-specific mortality was low regardless of the treatment, with no significant difference among treatments. Surgery and radiotherapy were associated with lower incidences of disease progression and metastasis vs. active monitoring.

Methods: 1643 men randomized into active monitoring (545), surgery (553), and radiotherapy (545).

- Primary outcome:** prostate-cancer mortality at median 10 year follow-up.
- Secondary outcomes:** rate of disease progression, metastases, and all-cause deaths.

Results:

- Primary outcome:** 17 prostate-cancer-specific deaths overall; 8 in active-monitoring group, 5 in the surgery group, and 4 in the radiotherapy group; difference among the groups was not significant (p=0.48). No significant difference was seen among groups in numbers of deaths from any cause (169 deaths overall; p=0.87).
- Secondary outcomes:** metastases developed more in active monitoring group (33 men) vs. surgery group (13 men) or radiotherapy group (16 men) (overall p=0.004). Higher rates of disease progression in active-monitoring group (112 events) vs. surgery group (46 events) or radiotherapy group (46 events) (p<0.001 for the overall comparison).

Long-Term Follow-Up on PSA Screening
Lancet 2014;384(9959):2027-2035

Summary: With 13 yr follow-up, the mortality reduction remains unchanged (21%, and 29% after non-compliance adjustment). However, the number needed to screen and to treat is decreasing, and is now below the number needed to screen observed in breast cancer trials.

Methods: multi-centre RCT with predefined central database, analysis, and core age group (55-69 years) evaluating PSA in 8 European countries. Incidence and mortality truncated at 9, 11, and 13 years follow-up in the intervention arm was compared to control arm.

Results: RR of PCa incidence between intervention and control arms was 1.91 after 9 yr follow-up, 1.66 at 11 year follow-up, and 1.67 at 13 yr follow-up. RR of PCa mortality was 0.85, 0.78, and 0.79, at 9, 11, 13 yr follow-up, respectively. RRR is 21%, and ARR from death is 1.28 per 1000 men.

Causes of Increased PSA

BPH, prostatitis, prostatic ischemia/infarction, prostate biopsy/surgery, prostatic massage, acute urinary retention, urethral catheterization, cystoscopy, TRUS, strenuous exercise, perineal trauma, ejaculation, acute renal failure, coronary bypass graft, radiation therapy

PSA is specific to the PROSTATE, but NOT to prostate cancer

- Long-Term Care and United States Preventative Services Task Force all recommend against PSA testing as a population-wide screening tool
- however, serum PSA screening recommended in any man with >10 yr life-expectancy and any of the following:
 - suspicious finding on DRE
 - moderate-severe LUTS
 - high risk individuals
 - investigating secondary carcinoma of unknown origin to rule out CaP as primary

Canadian Urological Association Guidelines (2011) re: CaP Screening

- harms and benefits of PSA testing must be explained to the patient and an informed, shared decision to test must be established
- initial screening should include both serum PSA and DRE
- all men should be offered screening at age 50 if >10 yr life-expectancy
- high-risk individuals (family Hx of CaP or African ancestry) should be offered screening at age 40 if >10 yr life-expectancy
- standard has been annual screening, but q2-4yr screening acceptable
- no strict cutpoint for when to biopsy; decision to biopsy should be based on more than a single PSA value
- AUA guidelines recommend against universal routine PSA screening for CaP

Screening for Prostate Cancer

Cochrane DB Syst Rev 2013;1:CD004720

Background: Screening for prostate cancer has an unclear benefit for reducing prostate cancer-specific mortality and morbidity.

Study: Systematic review of randomized clinical trials of screening vs. no screening. A total of 31 trials were retrieved for this review.

Results: A meta-analysis of 5 RCTs with 341,342 participants was done. Collectively, there was no significant reduction in prostate cancer-specific mortality within 10 yr of follow-up. Screening procedures and biopsies were commonly associated with bleeding, bruising, and short-term anxiety; subsequent over-diagnosis and overtreatment resulted in additional harms, some severe.

Conclusions: Men who have a life expectancy less than 10-15 yr should be informed that screening for prostate cancer is unlikely to be beneficial. Significant harms are associated with screening, over-diagnosis, and overtreatment.

Testicular Tumours

Etiology/Risk Factors

- cryptorchidism, atrophy, sex hormones, HIV infection, infertility, family Hx, past Hx of testicular cancer

Epidemiology

- rare, but most common solid malignancy in young males 15-35 yr
- any solid testicular mass or acute hydrocoele in young patient – must rule out malignancy
- slightly more common in right testis (corresponds with slightly higher incidence of right-sided cryptorchidism)
- 2-3% bilateral (simultaneously or successively)

Pathology

- primary
 - 1% of all malignancies in males
 - cryptorchidism has increased risk (10-40x) of malignancy
 - 95% are germ cell tumours (all are malignant)
 - ♦ seminoma (35%) → classic, anaplastic, spermatocytic
 - ♦ NSGCT → embryonal cell carcinoma (20%), teratoma (5%), choriocarcinoma (<1%), yolk sac (<<1%), mixed cell type (40%)
 - 5% are non-germ cell tumours (usually benign) → Leydig (testosterone, precocious puberty), Sertoli (gynecomastia, decreased libido)
- secondary
 - male >50 yr
 - usually lymphoma or metastases (e.g. lung, prostate, GI)

Clinical Features

- painless testicular enlargement (painful if intratesticular hemorrhage or infarction)
- dull, heavy ache in lower abdomen, anal area or scrotum
- associated hydrocele (10%)
- coincidental trauma (10%)
- infertility (rarely presenting complaint)
- gynecomastia due to secretory tumour effects
- supraclavicular and inguinal lymphadenopathy
- abdominal mass (retroperitoneal lymph node mets)

Methods of Spread

- local spread follows lymphatics
 - right → medial, paracaval, anterior and lateral nodes
 - left → left lateral and anterior paraaortic nodes
 - “cross-over” metastases from right to left are fairly common, but no reports from left to right
- hematogenous most commonly to lung, liver, bones, and kidney

Investigations

- diagnosis is established by pathological evaluation of specimen obtained by radical inguinal orchidectomy
- tumour markers (β-hCG, LDH, AFP)
 - β-hCG and AFP are positive in 85% of non-seminomatous tumours
 - elevated marker levels return to normal post-operatively if no metastasis
 - β-hCG positive in 7% of pure seminomas, AFP never elevated with seminoma

Testes and scrotum have different lymphatic drainage, therefore trans-scrotal approach for biopsy or orchiectomy should be avoided

- testicular U/S (hypoechoic area within tunica albuginea = high suspicion of testicular cancer)
- evidence of testicular microlithiasis is not a risk factor for testicular cancer
- needle aspiration contraindicated

Staging

- clinical: CXR (lung mets), markers for staging (β -hCG, AFP, LDH), CT abdomen/pelvis (retroperitoneal lymphadenopathy)
 - Stage I: disease limited to testis, epididymis, or spermatic cord
 - Stage II: disease limited to the retroperitoneal nodes
 - Stage III: disease metastatic to supradiaphragmatic nodal or visceral sites

Table 22. 2010 TNM Classification of Testicular Carcinoma

T	N	M
Tis: intratubular germ cell neoplasia	N0: no regional lymph node metastasis	M0: no distant mets
T1: limited to testis and epididymis without vascular/lymphatic invasion	N1: Metastasis with a lymph node mass 2 cm or less in greatest dimension; or multiple lymph nodes, none more than 2 cm in greatest dimension	M1: distant mets
T2: limited to testis and epididymis with vascular/lymphatic invasion	N2: Metastasis with a lymph node mass more than 2 cm but not more than 5 cm in greatest dimension	M1a: nonregional lymph node(s) or pulmonary mets
T3: invasion of the spermatic cord \pm vascular/lymphatics	N3: Metastasis with a lymph node mass more than 5 cm in greatest dimension	M1b: distant mets other than to regional lymph nodes and lung
T4: invasion of the scrotum \pm vascular/lymphatics		

Management

- orchiectomy through inguinal ligament for all stages
- consider sperm banking, testicular prosthesis
- adjuvant therapies (see figure 13)

Prognosis

- 99% cured with stage I and II disease
- 70-80% complete remission with advanced disease

Orchiopexy

Surgical descent (orchiopexy) of undescended testis does not eliminate the risk of malignancy, but allows for earlier detection by self-examination and reduces the risk of infertility

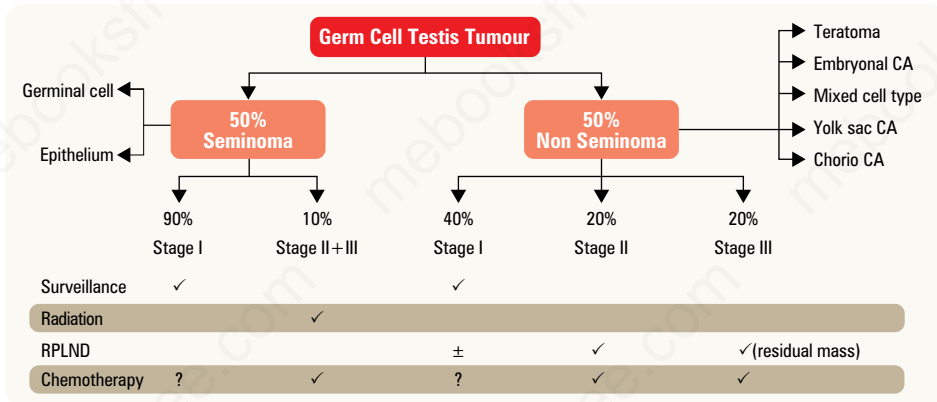

Figure 13. Adjuvant management of testicular cancer post-orchiectomy Adapted from Dr. MAS Jewett

Penile Tumours

Epidemiology

- rare (<1% of cancer in males in U.S.)
- most common in 6th decade

Benign

- cyst, hemangioma, nevus, papilloma

Pre-Malignant

- balanitis xerotica obliterans, leukoplakia, Buschke-Lowenstein tumour (large condyloma)

Pre-invasive Cancer

- carcinoma *in situ*
 - Bowen's disease \rightarrow crusted, red plaques on the shaft
 - erythroplasia of Queyrat \rightarrow velvet red, ulcerated plaques on the glans
 - treatment options: local excision, laser, radiation, topical 5-fluorouracil

Malignant

- risk factors
 - chronic inflammatory disease
 - STI
 - phimosis
 - uncircumcised penis
- 2% of all urogenital cancers
- SCC (>95%), basal cell, melanoma, Paget’s disease of the penis (extremely rare)
- definitive diagnosis requires full thickness biopsy of lesion
- lymphatic spread (superficial/deep inguinal nodes → iliac nodes) >> hematogenous

Treatment

- wide surgical excision with tumour-free margins (dependent on extent and area of penile involvement) ± lymphadenectomy
- consider less aggressive treatment modalities in CIS (cryotherapy, laser therapy, etc.) if available

Scrotal Masses

Table 23. Differentiating between Scrotal Masses

Condition	Pain	Palpation	Additional Findings
Torsion	+	Diffuse tenderness Horizontal lie of testicle	Absent cremaster reflex, negative Prehn’s sign
Epididymitis (U16)	+	Epididymal tenderness	Present cremaster reflex, positive Prehn’s sign
Orchitis (U16)	+	Diffuse tenderness	Present cremaster reflex, positive Prehn’s sign
Hematocele	+	Diffuse tenderness	No transillumination
Hydrocele	-	Testis not separable from hydrocele, cord palpable	Transillumination, Hx of trauma
Spermatocele	-	Testis separable from spermatocele, cord palpable	Transillumination
Varicocele	-	Bag of worms	No transillumination, increases in size with valsalva, decrease in size if supine
Indirect Inguinal	- (+ if strangulated)	Testis separable from hernia, cord not palpable, cough impulse may transmit, may be reducible	No transillumination
Tumour	- (+ if hemorrhagic)	Hard lump/nodule	
Generalized/Dependent edema	-	Diffuse swelling	Often post-operative or immobilized, check for liver dysfunction
Idiopathic	-		

Varicocele Grading

- Grade 1: Palpable only with Valsalva manoeuvre
- Grade 2: Palpable without Valsalva
- Grade 3: Visible through scrotal skin

Suspect a Retroperitoneal Mass/Process in a Patient with a Varicocele if

- Acute onset
- Right sided (isolated)
- Palpable abdominal mass
- Does not reduce while supine

Indications for Treatment of Varicocele

- Impaired sperm quality or quantity
- Pain or dull ache affecting QOL
- Affected testis fails to grow in adolescents
- Cosmetic indications (especially in adolescents)

Table 24. Benign Scrotal Masses

Type	Varicocele	Spermatocele	Hydrocele	Testicular Torsion	Inguinal Hernia
Definition	Dilatation and tortuosity of pampiniform plexus	A benign, sperm filled epididymal retention cyst	Collection of serous fluid that results from a defect or irritation in the tunica vaginalis	Twisting of the testicle causing venous occlusion and engorgement as well as arterial ischemia and infarction	Protrusion of abdominal contents through the inguinal canal into the scrotum
Etiology	15% of men Due to incompetent valves in the testicular veins 90% left sided	Multiple theories, including: Distal obstruction Aneurysmal dilations of the epididymis Agglutinated germ cells	Usually idiopathic Found in 5-10% testicular tumours Associated with trauma/infection Communicating: patent processus vaginalis, changes size during day (peds) Non-communicating: non-patent processus vaginalis (adult)	Trauma Cryptorchidism “Bell clapper deformity” Many occur in sleep (50%) Necrosis of glands in 5-6 h	Indirect (through internal ring, often into scrotum): congenital Direct (through external ring, rarely into scrotum): abdominal muscle weakness
Hx/P/E	“Bag of worms” Often painless Pulsates with Valsalva	Non-tender, cystic mass Transilluminates	Non-tender, intrascrotal mass Cystic Transilluminates	Acute onset severe scrotal pain, swelling GI upsets cases Retracted and transverse testicle (horizontal lie) Negative Phren’s sign Absent cremasteric reflex	A small bulge in the groin that may increase in size with Valsalva and disappear when lying down Can present as a swollen or enlarged scrotum Discomfort or sharp pain – especially when straining, lifting, or exercising
Investigations	P/E Valsava	P/E U/S to rule out tumour	U/S to rule out tumour	U/S Doppler with probe over testicular artery Decrease uptake on ^{99m} Tc-pertechnetate scintillation scan (doughnut sign)	Hx and P/E Invagination of the scrotum Valsalva
Treatment	Conservative Surgical ligation of testicular veins Percutaneous vein occlusion (balloon, sclerosing agents) Repair may improve sperm count/motility 50-75%	Conservative Avoid needle aspiration as it can lead to infection, reaccumulation and spilling of irritating sperm within scrotum Excise if symptomatic	Conservative Needle drainage Surgical	Emergency surgical exploration and bilateral orchiopexy Definitive diagnosis NOT necessary to take to OR Orchiectomy if poor prognosis	Surgical repair

TORSION OF TESTICULAR APPENDIX

- twisting of testicular/epididymal vestigial appendix

Signs and Symptoms

- clinically similar to testicular torsion, but vertical lie and cremaster reflex preserved
- “blue dot sign”
 - blue infarcted appendage seen through scrotal skin in children (can usually be palpated as small, tender lump)

Treatment

- analgesia – most will subside over 5-7 d
- surgical exploration and excision if refractory pain

HEMATOCELE

- trauma with bleed into tunica vaginalis
- U/S helpful to exclude fracture of testis which requires surgical repair

Treatment

- ice packs, analgesics, surgical repair

Acute scrotal swelling/pain in young boys is torsion until proven otherwise

Transillumination refers to light being transmitted through tissue (i.e. due to excess fluid)

Differential of a Benign Scrotal Mass

HIS BITS

- H**ydrocele
- I**nfection (epididymitis/orchitis)
- S**perm (spermatocele)
- B**lood (hematocele)
- I**ntestines (hernia)
- T**orsion
- S**ome veins (varicocele)

Penile Complaints

Table 25. Penile Complaints

Type	Peyronie’s Disease (Figure 14)	Priapism	Paraphimosis	Phimosis	Premature Ejaculation
Definition	Acquired curvature of penile shaft secondary to fibrous thickening of tunica albuginea	Prolonged erection lasting >4 h in the absence of sexual excitement/desire	Retracted Foreskin (behind glans penis) that cannot be reduced	Inability to retract foreskin over glans penis	Ejaculation prior to when one or both partners desire it, either before or soon after penetration
Etiology	Etiology unknown Trauma/repeated inflammation Familial predisposition Associated with DM, vascular disease, autoimmunity, Dupuytren’s contracture, erectile dysfunction, urethral instrumentation	50% idiopathic Ischemic (common) Thromboembolic (sickle cell) Non-Ischemic Trauma Medications Neurogenic	Iatrogenic (post cleaning/instrumentation) Trauma Infectious (balanitis, balanoposthitis)	Congenital (90% natural separation by age 3) Balanitis Poor Hygiene	Psychological factors Primary: no period of acceptable control Secondary: symptoms after a period of control, not associated with general medical condition
Hx/P/E	Penile curvature/shortening Pain with erection Poor erection distal to plaque	Painful erection ± signs of necrosis Note: <i>non-ischemic (high flow)</i> priapism may present without pain	Painful, swollen glans penis, foreskin Constricting band proximal to corona Dysuria, decreased urinary stream in children	Limitation and pain when attempting to retract foreskin Balanoposthitis (infection of prepuce)	Ejaculatory latency ≥1 min Inability to control or delay ejaculation Psychological distress
Investigations	Hx and P/E	Hx and P/E Cavernosal blood gas analysis Doppler US of the penis	Hx and P/E	Hx and P/E	Hx and P/E Testosterone levels if in conjunction with impotence
Treatment	Watchful waiting (spontaneous resolution in up to 12%) Medical management: Intravesical or topical verapamil Surgical management: Incision/excision of plaque Shortening of less affected side ± penile prosthesis	Treat reversible causes High-flow: Self-limited Consider arterial embolization Low-flow: Needle aspirated decompression Phenylephrine intracorporeal injection q3-5min Surgical shunt no response within 1 h	Manual pressure (with analgesia) Dorsal slit Circumcision (urgent or electively to prevent recurrence)	Proper hygiene Topical corticosteroids Dorsal slit Circumcision	Rule out medical condition Address psychiatric concerns, counselling Medication: SSRI or clomipramine Topical lidocaine-prilocaine

Erectile Dysfunction

Definition

- consistent (>3 mo duration) or recurrent inability to obtain or maintain an adequate erection for satisfactory sexual performance

Testosterone deficiency is an uncommon cause of ED

Physiology

- erection involves the coordination of psychological, neurologic, hemodynamic, mechanical, and endocrine components
- nerves: sympathetic (T11-L2), parasympathetic (S2-4), somatic (dorsal penile/pudendal nerves [S2-4])
- erection (“POINT”)
 - parasympathetics → NO release → increased cGMP within corpora cavernosa leading to:
 1. arteriolar dilatation
 2. sinusoidal smooth muscle relaxation → increased arterial inflow and compression of penile venous drainage (decreased venous outflow)

Erections POINT AND SHOOT

parasympathetics = **point**; and sympathetics/somatics = **shoot**

- emission (“SHOOT”)
 - sensory afferents from glans
 - secretions from prostate, seminal vesicles, and ejaculatory ducts enter prostatic urethra (sympathetics)
- ejaculation (“SHOOT”)
 - bladder neck closure (sympathetic)
 - spasmodic contraction of bulbo-cavernosus and pelvic floor musculature (somatic)
- detumescence
 - sympathetic nerves, norepinephrine, endothelin-1 → arteriolar and sinusoidal constriction → penile flaccidity

Classification

Table 26. Classification of Erectile Dysfunction

	Psychogenic*	Organic*
Proportion	10%	90%
Onset	Sudden	Gradual
Frequency	Sporadic	All circumstances
Variation	With partner and circumstance	No
Age	Younger	Older
Organic Risk Factors (HTN, DM, dyslipidemia)	No organic risk factors	Risk factors present
Nocturnal/AM Erection	Present	Absent

*Combination can co-exist

Etiology (“IMPOTENCE”)

- Iatrogenic: pelvic surgery, pelvic radiation
- Mechanical: Peyronie’s, post-priapism
- Psychological: depression, stress, anxiety, PTSD, widower syndrome
- Occlusive: arterial HTN, DM, smoking, hyperlipidemia, PVD, impaired veno-occlusion
- Trauma: penile/pelvic, bicycling
- Extra factors: renal failure, cirrhosis, COPD, sleep apnea, malnutrition
- Neurogenic: CNS (e.g. Parkinson’s, MS, spinal cord injury, Guillain-Barré, spina bifida, stroke), PNS (e.g. DM, peripheral neuropathy)
- Chemical: antihypertensives, sedatives, antidepressants, antipsychotics, anxiolytics, anticholinergics, antihistamines, anti-androgens (including 5- α reductase inhibitors), statins, GnRH agonists, illicit drugs
- Endocrine: DM, hypogonadism, hyperprolactinemia, hypo/hyperthyroid

Diagnosis

- complete Hx (include sexual, medical, and psychosocial aspects)
- self-administered questionnaires (e.g. International Index of Erectile Function, Sexual Health Inventory for Men Questionnaire, ED Intensity Scale, ED Impact Scale)
- focused P/E, including vascular and neurologic examinations, secondary sexual characteristics
- lab investigations, dependent on clinical picture
 - risk factor evaluation: fasting blood glucose or HbA1c, cholesterol profile
 - optional: TSH, CBC, U/A, testosterone (free and total), prolactin, LH
- specialized testing including nocturnal penile tumescence monitoring usually unnecessary
- evaluation of penile vasculature only relevant with past history of trauma (i.e. pelvic fracture)

Treatment

- can often be managed by family doctor, see sidebar for when to refer
- must fully inform patient/partner of options, benefits and complications
- non-invasive
 - lifestyle changes (alcohol, smoking), psychological (sexual counselling and education)
 - change precipitating medications
 - treat underlying causes (DM, CVD, HTN, endocrinopathies)
- minimally invasive
 - oral medication (see *Common Medications, U42*)
 - ♦ sildenafil, tadalafil, vardenafil, avanafil (not available in Canada): inhibits PDE-5 to increase intracavernosal cyclic GMP levels
 - all four have similar effectiveness, difference in onset of action is not clinically significant
 - tadalafil has longer half-life, no cyanopsia, and can be taken on empty or full stomach
 - ♦ vacuum devices: draw blood into penis via negative pressure, then put ring at base of penis
 - ♦ MUSE: male urethral suppository for erection – vasoactive substance (PGE1) capsule inserted into urethra
- invasive
 - intracavernous vasodilator injection/self-injection
 - ♦ triple therapy (papaverine, phentolamine, PGE1) or PGE1 alone
 - ♦ complications: priapism (overdose), fibrosis of tunica albuginea at site of repeated injections (Peyronie’s plaque) and injection site injuries (pain, hematoma, etc.)
- surgical
 - penile implant (last resort): malleable or inflatable
 - penile artery reconstruction (in young men with isolated vascular lesion – investigational)

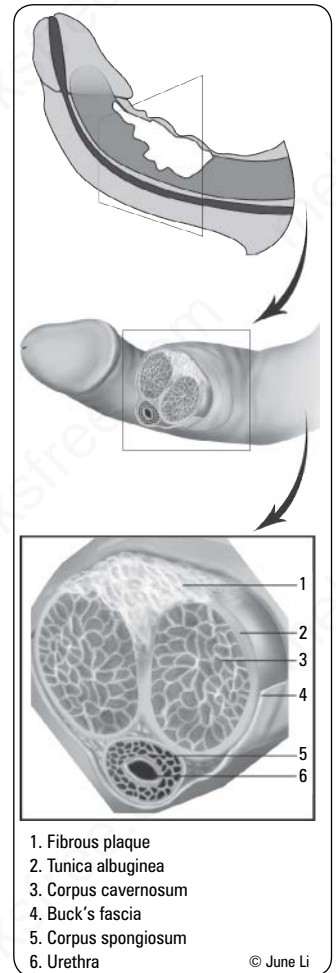

Figure 14. Peyronie’s disease

Penile vascular abnormalities may be a marker of risk for CV disease. Young men with vascular ED have 50x higher risk of having a CV event

When to Consider Referral

FAT PEN
 Failed medical therapy
 penile Anatomic abnormality
 pelvic/perineal Trauma
 Psychogenic cause
 Endocrinopathy
 vascular/Neurologic assessment

PDE-5 inhibitors are contraindicated in patients on nitrates/nitroglycerin due to severe hypotension

Initial trial of MUSE® or intracavernosal injection should be done under medical supervision

Trauma

- see [Emergency Medicine, ER7](#)

Renal Trauma

Classification According to Severity

- minor
 - contusions and superficial lacerations/hematomas: 90% of all blunt traumas, surgical exploration seldom necessary
- major
 - laceration that extends into medulla and collecting system, major renal vascular injury, shattered kidney

Etiology

- 80% blunt (MVC, assaults, falls) vs. 20% penetrating (stab wounds and gunshots)

Clinical Features

- mechanism of injury raises suspicion
- can be hemodynamically unstable secondary to renal vascular injury and/or other sustained injuries: ABCs
- upper abdominal tenderness, flank tenderness, flank contusions, lower rib/vertebral transverse process fracture

Investigations

- U/A
 - hematuria: requires workup but degree does not correlate with the severity of injury
- imaging
 - CT (contrast, triphasic) if patient stable: look for renal laceration, extravasation of contrast, retroperitoneal hematoma, and associated intra-abdominal organ injury

Staging (does not necessarily correlate well with clinical status)

- I: contusion/hematoma
- II: <1 cm laceration without urinary extravasation
- III: >1 cm laceration without urinary extravasation
- IV: laceration causing urinary extravasation and/or main arterial or vein injury with contained hematoma
- V: shattered kidney or avulsion of pedicle

Treatment

- microscopic hematuria + isolated well-staged minor injuries → no hospitalization
- gross hematuria + contusion/minor lacerations → hospitalize, bedrest, repeat CT if bleeding persists
- surgical intervention/minimally invasive angiography and embolization
 - absolute indications
 - ◆ hemorrhage and hemodynamic instability
 - relative indications
 - ◆ non-viable tissue and major laceration
 - ◆ urinary extravasation
 - ◆ vascular injury
 - ◆ expanding or pulsating peri-renal mass
 - ◆ laparotomy for associated injury
- follow-up with U/S or CT before discharge, and at 6 wk

Complications

- HTN in 5% of renal trauma

Bladder Trauma

Classification

- contusions: no urinary extravasation, damage to mucosa or muscularis
- intraperitoneal ruptures: often involve the bladder dome
- extraperitoneal ruptures: involve anterior or lateral bladder wall in full bladder

Etiology

- blunt (MVC, falls, and crush injury) vs. penetrating trauma to lower abdomen, pelvis, or perineum
- blunt trauma is associated with pelvic fracture in 97% of cases

Clinical Features

- abdominal tenderness, distention, peritonitis, and inability to void
- can be hemodynamically unstable secondary to pelvic fracture, other sustained injuries: ABCs
- suprapubic pain

Investigations

- U/A: gross hematuria in 90%
- imaging (including CT cystogram and post-drainage films for extravasation)

Treatment

- penetrating trauma → surgical exploration
- contusion → urethral catheter until hematuria completely resolves
- extraperitoneal bladder perforations → typically non-operative with foley insertion, and follow with cystograms
 - surgery if: infected urine, rectal/vaginal perforation, bony spike into bladder, laparotomy for concurrent injury, bladder neck involvement, persistent urine leak and failed conservative management
- intraperitoneal rupture usually requires surgical repair and suprapubic catheterization

Complications

- complications of bladder injury itself are rare
- mortality is around 20%, and is usually due to associated injuries rather than bladder rupture

Urethral Injuries

Etiology

- posterior urethra
 - common site of injury is junction of membranous and prostatic urethra due to blunt trauma, MVCs, pelvic fracture
 - shearing force on fixed membranous and mobile prostatic urethra
- anterior urethra
 - straddle injury can crush bulbar urethra against pubic rami
- other causes
 - iatrogenic (instrumentation, prosthesis insertion), penile fracture, masturbation with urethral manipulation
- always look for associated bladder rupture

Clinical Features

- blood at urethral meatus
- high-riding prostate on DRE
- swelling and butterfly perineal hematoma
- penile and/or scrotal hematoma
- sensation of voiding without U/O
- distended bladder

Investigations

- must perform RUG or cystoscopy prior to catheterization

Treatment

- simple contusions
 - no treatment
- partial urethral disruption
 - very gentle attempt at catheterization by urologist
 - with no resistance to catheterization → Foley x 2-3 wk
 - with resistance to catheterization → suprapubic cystostomy or urethral catheter alignment
- periodic flow rates/urethrograms to evaluate for stricture formation
- complete disruption
 - immediate repair if patient stable, delayed repair if unstable (suprapubic tube in interim)

Complications

- stricture

All patients with suspected urethral injury should undergo RUG

Infertility

Definition

- failure to conceive after one year of frequent, unprotected and properly timed intercourse
- incidence
 - 15% of all couples (35-40% female, 20% male, 25-30% combined)

Female Factors

- see [Gynecology, GY23](#)

Male Factors

Male Reproduction

- hypothalamic-pituitary-testicular axis (HPTA)
 - pulsatile GnRH from hypothalamus acts on anterior pituitary stimulating release of LH and FSH
 - LH acts on Leydig (interstitial) cells → testosterone synthesis and secretion
 - FSH acts on Sertoli cells → structural and metabolic support to developing spermatogenic cells
 - FSH and testosterone support germ cells (responsible for spermatogenesis)
 - sperm route: epididymis → vas deferens → ejaculatory ducts → prostatic urethra

Etiology

- idiopathic (40-50% infertile males)
- testicular
 - varicocele (35-40% infertile males)
 - tumour
 - congenital (Klinefelter's triad: small, firm testes, gynecomastia, and azoospermia)
 - post-infectious (epididymo-orchitis, STIs, mumps)
 - uncorrected torsion
 - cryptorchidism (<5% of cases)
- obstructive
 - iatrogenic (surgery: see below)
 - infectious (gonorrhea, chlamydia)
 - trauma
 - congenital (absence of vas deferens, CF)
 - bilateral ejaculatory duct obstruction, epididymal obstructions
 - Kartagener's syndrome (autosomal recessive disorder causing defect in action of cilia)
- endocrine (see [Endocrinology, E45](#))
- HPTA (2-3%) e.g. Kallmann's syndrome (congenital hypothalamic hypogonadism), excess prolactin, excess androgens, excess estrogens
- other
 - retrograde ejaculation secondary to surgery
 - medications
 - prior exposure to chemotherapy or pelvic radiation
 - drugs: marijuana, cocaine, tobacco, alcohol
 - increased testicular temperature (sauna, hot baths, tight pants or underwear)
 - chronic disease: e.g. liver, renal

History

- age of both partners
- medical: past illness, DM, trauma, CF, genetic syndromes, STIs, cryptorchidism
- surgical: vasectomy, herniorrhaphy, orchidopexy, prostate surgery
- fertility: pubertal onset, previous pregnancies, duration of infertility, treatments
- sexual: libido, erection/ejaculation, timing, frequency
- family Hx
- medications: cytotoxic agents, GnRH agonists, anabolic steroids, nitrofurantoin, cimetidine, sulfasalazine, spironolactone, α -blockers
- social Hx: alcohol, tobacco, cocaine, marijuana, school performance/learning disabilities (suggestive of Klinefelter syndrome)
- occupational exposures: radiation, heavy metals

Physical Exam

- general appearance: sexual development, gynecomastia, obesity, pubic hair
- scrotal exam: size, consistency, and nodularity of testicles; palpation of cord for presence of vas deferens; DRE; valsalva for varicocele

Investigations

- semen analysis (SA) at least 2 specimens, collected 1-2 wk apart
- hormonal evaluation
 - indicated with abnormal SA (rare to be abnormal with normal SA)
 - testosterone and FSH
 - serum LH and prolactin are measured if testosterone or FSH are abnormal
- genetic evaluation
 - chromosomal studies (Klinefelter's syndrome - XXY)
 - genetic studies (Y-chromosome microdeletion, CF gene mutation)
- immunologic studies (antisperm antibodies in ejaculate and blood)
- testicular biopsy
- scrotal U/S (varicocele, testicular size)
- vasography (assess patency of vas deferens)

Treatment

- assessment of partner
- lifestyle
 - regular exercise, healthy diet
 - eliminate alcohol, tobacco and illicit drugs
- medical
 - endocrine therapy (see [Endocrinology, E](#))
 - treat retrograde ejaculation
 - discontinue anti-sympathomimetic agents, may start α -adrenergic stimulation (phenylpropranolamine, pseudoephedrine, or ephedrine)
 - treat underlying infections
- surgical
 - varicolectomy (if indicated)
 - vasovasostomy (vasectomy reversal) or epididymovasostomy
 - transurethral resection of blocked ejaculatory ducts
- assisted reproductive technologies (ART)
 - refer to infertility specialist
 - sperm washing + intrauterine insemination (IUI)
 - *in vitro* fertilization (IVF)
 - intracytoplasmic sperm injection (ICSI) after CF screening of patient and partner in patients with congenital bilateral absence of vas deferens

Normal Semen Values

- Volume: 2-5 mL
- Concentration: > 15 million sperm/mL
- Morphology: 30% normal forms
- Motility: >40% adequate forward progression
- Liquefaction: complete in 20 min
- pH: 7.2-7.8
- WBC: <10/HPF or <106 WBC/mL semen

Common Terminology on SA

- Teratospermia: Abnormal morphology
- Asthenospermia: Abnormal motility
- Oligospermia: Decreased sperm count
- Azoospermia: Absent sperm in semen
- Mixed types: i.e. oligoasthenospermia

Mutation of cystic fibrosis transmembrane conductance regulator (CFTR) gene is associated with congenital bilateral absence of vas deferens and epididymal cysts, even if patient manifests no symptoms of CF

WHO Guidelines Male Infertility Factors

- SPERM COUNT**
- Systemic factor/Smoking
- Psychological illness
- Endocrinopathy
- Retrograde ejaculation
- Medications
- Chronic disease
- Obstructive
- Unexplained
- Narcotics
- Testicular

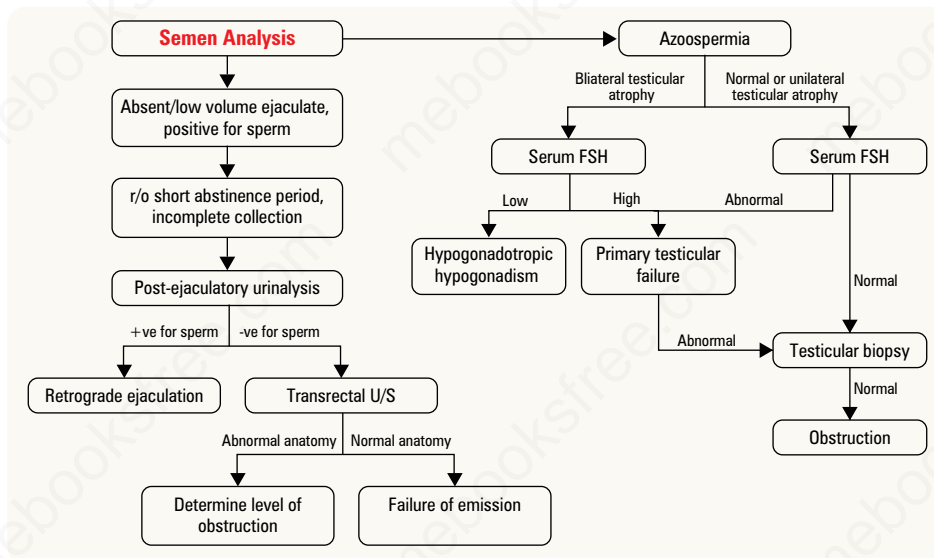

Figure 15. Infertility workup

Pediatric Urology

Congenital Abnormalities

- not uncommon; 1/200 have congenital abnormalities of the GU tract
- six common presentations of congenital urological abnormalities

1. ANTENATAL HYDRONEPHROSIS

Epidemiology

- 1-5% fetal U/S, some detectable as early as first trimester
- most common urological consultation in perinatal period and one of most common U/S abnormalities of pregnancy

Differential Diagnosis

- UPJ or UVJ obstruction
- multi-cystic dysplastic kidney
- VUR
- PUVs (only in boys)
- duplication anomalies
- ureterocele
- ectopic ureter

Treatment

- antenatal *in utero* intervention rarely indicated unless evidence of lower urinary tract obstruction with oligohydramnios

Majority of antenatal hydronephroses resolve during pregnancy or within the first year of life

2. POSTERIOR URETHRAL VALVES

Epidemiology

- the most common congenital obstructive urethral lesion in male infants

Pathophysiology

- abnormal mucosal folds at the distal prostatic urethra causing varying degrees of obstruction

Clinical Presentation

- dependent on age
 - antenatal: bilateral hydronephrosis, distended bladder, oligohydramnios
 - neonatal (recognized at birth): palpable abdominal mass (distended bladder, hydronephrosis), urinary ascites (transudation of retroperitoneal urine), respiratory distress (pulmonary hypoplasia from oligohydramnios), weak urinary stream
 - neonatal (not recognized at birth): within weeks present with urosepsis, dehydration, electrolyte abnormalities, failure to thrive; rule out pyloric stenosis, which may present similarly
 - toddlers: UTIs or voiding dysfunction
 - school-aged boys: voiding dysfunction → urinary incontinence
- associated findings include renal dysplasia and secondary VUR

Investigations

- most commonly recognized on prenatal U/S → bilateral hydronephrosis, thickened bladder, dilated posterior urethra ("keyhole sign"), oligohydramnios in a male fetus
- VCUG → dilated and elongated posterior urethra, trabeculated bladder, VUR

Treatment

- immediate catheterization to relieve obstruction, followed by cystoscopic resection of PUV when baby is stable
- if resection of PUV is not possible, vesicostomy is indicated

3. URETEROPELVIC JUNCTION OBSTRUCTION

Etiology

- unclear: adynamic ureteral segment, stenosis, strictures, extrinsic compression, aberrant blood vessels
- can rarely be secondary to tumour, stone, etc, in children

Epidemiology

- the most common congenital defect of the ureter
- M:F = 2:1
- up to 40% bilateral, which may be associated with worse prognosis

Clinical Presentation

- symptoms depend on severity and age at diagnosis (mostly asymptomatic finding on antenatal U/S)
 - infants: abdominal mass, urinary infection
 - children: pain, vomiting, failure to thrive
- some cases are diagnosed after puberty and into adulthood
 - in adolescents and adults, the symptoms may be triggered by episodes of increased diuresis, such as following alcohol ingestion (Dietl's crisis)

Investigations

- antenatal: serial U/S most common, and renal scan \pm furosemide

Treatment

- surgical correction (pyeloplasty), consider nephrectomy if $<15\%$ differential renal function

4. VESICoureTERAL REFLUX

Definition

- retrograde passage of urine from the bladder, through the UVJ, into the ureter

Classification

- primary reflux: incompetent or inadequate closure of UVJ
 - lateral ureteral insertion, short submucosal segment
- secondary reflux: abnormally high intravesical pressure resulting in failure of UVJ closure
 - often associated with anatomic (PUV) or functional (neuropathic) bladder dysfunction

Epidemiology

- estimated $\sim 1\%$ of newborns, but not well known
- incidence and clinical relevance higher in children with febrile UTIs and prenatal hydronephrosis
- risk factors: race (white $>$ black), female gender, age (<2 yr), genetic predisposition

Investigations

- focused Hx, particularly of voiding dysfunction (frequency, urgency, diurnal enuresis, constipation, encopresis)
 - also screen for infections (UTI, pyelonephritis, urosepsis) and renal failure (uremia, HTN)
- initial evaluation of renal status, growth parameters, and blood pressure is warranted in any child with VUR due to relatively high incidence of renal scarring
 - height, weight, blood pressure
 - serum Cr
 - U/A, C&S
 - renal U/S
 - DMSA renal scan if at high risk (greater sensitivity in detecting structural defects associated with dysplasia, renal scarring or pyelonephritis; entails radiation exposure)
 - sibling family screening is controversial

Treatment

- spontaneous resolution in 60% of primary reflux
 - in lower grades (I-III), goal is to prevent infection or renal damage via medical treatment
- medical treatment: daily ABx prophylaxis at half the treatment dose for acute infection (see Table 9, U12 - TMP/SMX, trimethoprim, amoxicillin, or nitrofurantoin)
- surgical treatment: ureteral reimplantation \pm ureteroplasty, or subureteral injection with bulking agents (Deflux[®] or Macroplastique[®])
 - indications include failure of medical management, renal scarring (e.g. renal insufficiency, HTN), breakthrough UTIs, persistent high grade (IV or V) reflux

5. HYPOSPADIAS

Definition

- a condition in which the urethral meatus opens on the ventral side of the penis, proximal to the normal location in the glans penis
- depending on severity, may result in difficulty directing urinary stream, having intercourse or depositing sperm in vagina

Epidemiology

- very common; 1/300 live male births
- distal hypospadias more common than proximal
- white \gg black
- may be associated with ventral penile curvature, disorders of sexual differentiation, undescended testicles or inguinal hernia

Figure 16. VUR grading (based on cystogram)

VUR Grading (based on cystogram)

- Grade I: ureters only fill
- Grade II: ureters and pelvis fill
- Grade III: ureters and pelvis fill with some dilatation
- Grade IV: ureters, pelvis, and calyces fill with significant dilatation
- Grade V: ureters, pelvis, and calyces fill with major dilatation and tortuosity

Defer circumcision in patients with hypospadias

Treatment

- early surgical correction; optimal repair before 2 yr
- neonatal circumcision should be deferred because the foreskin may be utilized in the correction

6. EXSTROPHY-EPISPADIAS COMPLEX**Definition**

- a spectrum of defects depending on the timing of the rupture of the cloacal membrane
 - bladder exstrophy: congenital defect of a portion of lower abdominal and anterior bladder wall, with exposure of the bladder lumen
 - cloacal exstrophy
 - ♦ exposed bladder and bowel with imperforate anus
 - ♦ associated with spina bifida in >50%
 - epispadias (least severe)
 - ♦ urethra opens on dorsal aspect of the penis, often associated with penile curvature

Etiology

- represents failure of closure of the cloacal membrane, resulting in the bladder and urethra opening directly through the abdominal wall

Epidemiology

- rare: incidence 1/30,000, M:F = 3:1 predominance
- high morbidity → multiple reconstructive surgeries, incontinence, infertility, reflux

Treatment

- surgical correction at birth
- later corrections for incontinence, VUR, and low bladder capacity may be needed

Figure 17. Classification of hypospadias
(*account for 75%)

Nephroblastoma (Wilms' Tumour)**Etiology**

- arises from abnormal proliferation of metanephric blastema

Epidemiology

- 5-5-10: 5% of all childhood cancers, 5% bilateral, 10% associated with congenital malformation syndromes
- most common primary malignant renal tumour of childhood
- average age of incidence is 3 yr

Clinical Features

- abdominal mass: large, firm, unilateral (80%)
- HTN (25%)
- flank tenderness (30-40%)
- microscopic hematuria (12-25%)
- nausea/vomiting

Treatment

- always investigate contralateral kidney and renal vein (for tumour thrombus)
- unilateral disease: radical nephrectomy ± radiation ± chemotherapy
- bilateral disease: nephron-sparing surgery following neoadjuvant chemotherapy

Prognosis

- 5 yr survival 80%

Cryptorchidism/Ectopic Testes**Definition**

- abnormal location of testes somewhere along the normal path of descent (external inguinal ring > inguinal canal > abdominal)
- Denis Browne pouch (between external oblique fascia and Scarp's fascia) most common
- differential diagnosis:
 - retractile testes
 - atrophic testes
 - disorders of sexual differentiation (bilateral impalpable gonads)

Epidemiology

- 2.7% of full term newborns
- 0.7-0.8% at 1 yr

**Normal Testicular Development and Descent in Utero**

- 2nd month:** Testicle begins to form
- 4th month:** Begins to take on its normal appearance and migrates from its origin at the kidney to the internal inguinal ring
- 7th month:** The testis, surrounded in peritoneal covering, begins to descend through the internal ring, inguinal canal and external ring to terminate in the scrotum

Treatment

- orchiopexy
- hormonal therapy not proven to be of benefit over standard surgical treatment

Prognosis

- reduction in fertility
 - untreated bilateral cryptorchidism: ~100% infertility
 - paternity rates: 53%, 90%, and 93% in formerly bilateral cryptorchid, formerly unilateral cryptorchid, and normal men, respectively
- increased malignancy risk
 - intraabdominal > inguinal
 - surgical correction facilitates testicular monitoring and may reduce malignancy risk
- increased risk of testicular torsion (reduced by surgical correction)

Disorders of Sexual Differentiation

Definition

- formerly known as intersex disorders: considered social emergency
- abnormal genitalia for chromosomal sex due to the undermasculinization of males or the virilization of females

Classification

1. 46 XY DSD
 - defect in testicular synthesis of androgens
 - androgen resistance in target tissues
 - palpable gonad
2. 46 XX DSD
 - most due to CAH (21-hydroxylase deficiency most common enzymatic defect) → shunt in steroid biosynthetic pathway leading to excess androgens
 - undiagnosed and untreated CAH can be associated with life-threatening electrolyte abnormalities in the newborn (salt-wasting CAH)
3. ovotesticular DSD
4. mixed gonadal dysgenesis (46 XY/45 XO most common karyotype)
 - presence of Y chromosome → partial testis determination to varying degrees

Diagnosis

- thorough family Hx noting any consanguinity
- maternal Hx, especially medication/drug use during pregnancy (maternal hyperandrogenemia)
- P/E: palpable gonad (= chromosomal male), hyperpigmentation, evidence of dehydration, HTN, stretched phallus length, position of urethral meatus
- laboratory tests
 - plasma 17-OH-progesterone (after 36 h of life) → increased in CAH
 - plasma 11-deoxycortisol → increased in 11-β-hydroxylase deficiency
 - basal adrenal steroid levels
 - serum testosterone and DHT pre- and post-hCG stimulation (2,000 IU/d for 4 d)
 - serum electrolytes
 - chromosomal evaluation including sex karyotype
- U/S of adrenals, gonads, uterus, and fallopian tubes
- endoscopy and genitography of urogenital sinus

Treatment

- steroid supplementation as indicated (e.g. CAH)
- sex assignment after extensive family consultation
 - must consider capacity for sexually functioning genitalia in adulthood, fertility potential, and psychological impact
- reconstruction of external genitalia between 6 and 12 mo
- long-term psychological guidance and support for both patient and family

A phenotypic male newborn with bilateral non-palpable testicles should be considered 46XX with salt-wasting CAH and must undergo proper evaluation prior to discharge

Enuresis

- see [Pediatrics, P9](#)

Selected Urological Procedures

Bladder Catheterization

- catheter size measured by the French (Fr) scale – circumference in mm
- each 1 mm increase in diameter = approximately 3 Fr increase (standard size 14-18 Fr)
- should be removed as soon as possible to reduce the risk of UTI

Continuous Catheterization

- indications
 - accurate monitoring of U/O
 - relief of urinary retention due to medication, neurogenic bladder, or intravesical obstruction
 - temporary therapy for urinary incontinence
 - perineal wounds
 - clot prevention (22-24 Fr) for CBI
 - intra- and post-operative
 - comfort for end of life care

Alternatives to Continuous Catheterization

- intermittent catheterization
 - PVR measurement
 - to obtain sterile diagnostic specimens for U/A, urine C&S
 - management of neurogenic bladder or chronic urinary retention
- condom catheter
- suprapubic catheter

Causes of Difficult Catheterizations and Treatment

- patient discomfort → use sufficient lubrication (± xylocaine)
- collapsing catheter → lubrication as above ± firmer or larger catheter (silastic catheter)
- meatal/urethral stricture → dilate with progressively larger catheters/balloon catheter
- BPH → use coude catheter as angled tip can help navigate around enlarged prostate
- urethral disruption/obstruction → filiform and followers or suprapubic catheterization
- anxious patient → anxiolytic medication

Complications of Catheterization

- infection: UTI, bladder fistula, bladder perforation (rare)
- meatal/urethral trauma

Contraindications

- trauma: blood at the urinary meatus, scrotal hematoma, pelvic fracture, and/or high riding prostate

Circumcision

Definition

- removal of some or all of the foreskin from the penis

Epidemiology

- 30% worldwide
- frequency varies with geography, religious affiliation, socioeconomic status

Medical Indications

- phimosis and recurrent paraphimosis
- recurrent UTIs (particularly in infants and in association with other urinary abnormalities)
- balanitis xerotica obliterans or other chronic inflammatory conditions

Contraindications

- unstable or sick infant
- congenital genital abnormalities (hypospadias)
- family Hx of bleeding disorders warrants laboratory investigation prior to circumcision

Complications

- bleeding
- infection
- penile entrapment, skin bridges
- fistula
- glans injury
- penile sensation deficits

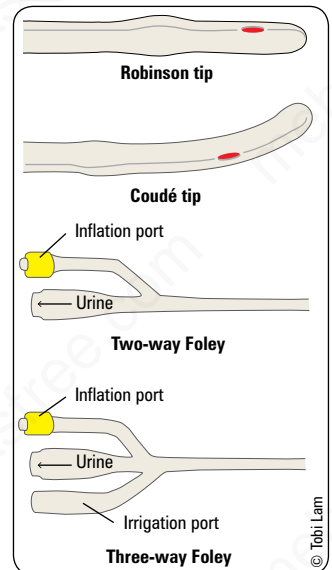

Figure 18. Transurethral (Foley) catheters

Male Circumcision for Prevention of Heterosexual Acquisition of HIV in Men

Cochrane DB Syst Rev 2009;2:CD003362

Purpose: To evaluate the effectiveness and safety of male circumcision for preventing acquisition of HIV in heterosexual men.

Methods: The analyzed data is from three randomized controlled trials to assess the efficacy of male circumcision for preventing HIV acquisition in men in Africa.

Results: Medical male circumcision reduces the acquisition of HIV by heterosexual men (38-66% over 24 mo).

Circumcision Status and Risk of HIV and Sexually Transmitted Infections among Men who have Sex with Men: A Meta-Analysis

JAMA 2008;300:1674-1684

Purpose: To describe the association between male circumcision and HIV infection and other sexually transmitted infections (STIs) among men who have sex with men (MSM).

Methods: Meta-analysis of 15 studies (n=53,567)

Results: The associations between circumcision and HIV-positive and STIs were not statistically significant. Male circumcision had a protective association with HIV in studies of MSM conducted before the introduction of highly active anti-retroviral therapy.

Conclusions: There is insufficient evidence to support that male circumcision protects against HIV infection or other STIs.

Male Circumcision

Pediatrics 2012;130:e756-e785

Study: Guidelines by the American Academy of Pediatrics (AAP).

Recommendations: The American Academy of Pediatrics radically changed their position on male circumcision in 2012. The report from the AAP now states that the preventative health benefits outweigh the risks of the procedure and that the procedure is well-tolerated with adequate pain management and sterility. Stated benefits include the prevention of urinary tract infection, penile cancer, transmission of some sexually transmitted infections, including HIV. There is believed to be no effect on penile sexual function, sensitivity or sexual satisfaction. Acute complications are rare and more common if the procedure is done by an untrained provider.

Note: The Canadian Pediatric Society (CPS) has not yet updated their position on male circumcision since 1996, which stated that the CPS is opposed to routine circumcision. A new statement is expected soon.

Cystoscopy

Objective

- endoscopic inspection of the lower urinary tract (urethra, prostate, bladder, and ureteral orifices), samples for cytology
- scopes can be flexible or rigid

Indications

- gross hematuria
- LUTS (storage or voiding)
- urethral and bladder neck strictures
- bladder stones
- bladder tumour surveillance
- evaluation of upper tracts with retrograde pyelography (ureteric stents, catheters)

Complications

- during procedure
 - bleeding
 - anesthetic-related
 - perforation (rare)
- post-procedure (short-term)
 - infections (antibiotic prophylaxis recommended)
 - urinary retention
- post-procedure (long-term)
 - stricture

Radical Prostatectomy

Objective

- the removal of the entire prostate and prostatic capsule via a lower midline abdominal incision, laparoscopically or robotically
 - internal iliac and obturator vessel lymph nodes may also be dissected and sent for pathology (dependent on risk: clinical stage, grade, PSA)
 - seminal vesicle vessels are also partially or completely removed

Indications

- treatment for localized prostate cancer

Complications

- immediate (intraoperative)
 - blood loss
 - rectal injury (extremely rare)
 - ureteral injury (extremely rare)
- perioperative
 - lymphocele formation if concurrent pelvic lymphadenectomy performed)
- late
 - moderate to severe urinary incontinence (3-10%)
 - mild urinary incontinence (20%)
 - ED (~50%, depending on whether one, both, or neither of the neurovascular bundles are involved in extracapsular extension of tumour)

Transurethral Resection of the Prostate (TURP)

Objective

- to partially resect the periurethral portion of the prostate (transition zone) to decrease symptoms of urinary tract obstruction
- accomplished via a transurethral (cystoscopic) approach using an electrocautery loop, irrigation (glycine), and illumination

Indications

- obstructive uropathy (large bladder diverticula, renal insufficiency)
- refractory urinary retention
- recurrent UTIs
- recurrent gross hematuria
- bladder stones
- intolerance/failure of medical therapy

Retropubic, Laparoscopic, and Robot-Assisted Radical Prostatectomy: A Critical Review of Outcomes Reported by High-Volume Centres

J Endourol 2010;24:2003-2015

Study: A systematic review to compare perioperative outcomes, positive surgical margin (PSM) rates, and functional outcomes in retropubic radical prostatectomy (RRP) laparoscopic RP (LRP) and robot-assisted radical prostatectomy (RARP).

Methods: Medline database was searched.

Weighted means (based on number of participants in each study) were calculated for all outcomes.

Results: 58 articles were reviewed. LRP and RARP were associated with better perioperative outcomes compared to RRP. RRP, LRP, and RARP had similar post-operative complication rates ranging from 10.3-10.98%. RARP had a lower overall PSM rate than LRP, and RRP. RARP had the highest continence rate and mean potency rates.

Conclusion: In high-volume centres, RRP, LRP and RARP are safe options for treating patients with localized prostate cancer. LRP and RARP are associated with better perioperative outcomes and RARP showed lower PSM rates, higher potency and continence compared to RRP and LRP.

Complications

- acute
 - intra- or extraperitoneal rupture of the bladder
 - rectal perforation
 - incontinence
 - incision of the ureteral orifice (with subsequent reflux or ureteral stricture)
 - hemorrhage
 - epididymitis
 - sepsis
 - transurethral resection syndrome (also called “post-TURP syndrome”)
 - ♦ caused by absorption of a large volume of the hypotonic irrigation solution used, usually through perforated venous sinusoids, leading to a hypervolemic hyponatremic state
 - ♦ characterized by dilutional hyponatremia, confusion, nausea, vomiting, HTN, bradycardia, visual disturbances, CHF, and pulmonary edema
 - ♦ treat with diuresis and (if severe) hypertonic saline administration
- chronic
 - retrograde ejaculation (>75%)
 - ED (5-10% risk increases with increasing use of cautery)
 - incontinence (<1%)
 - urethral stricture
 - bladder neck contracture

Extracorporeal Shock Wave Lithotripsy

Objective

- to treat renal and ureteral calculi (proximal, middle or distal) which cannot pass through the urinary tract naturally
- shockwaves focused onto stone → fragmentation, allowing stone fragments to pass spontaneously and less painfully

Indications

- potential first-line therapy for renal and ureteral calculi <2.5 cm
 - individuals with calculi in solitary kidney
 - individuals with HTN, DM or renal insufficiency
- *patient preference and wait-times play a large role in stone management

Contraindications

- acute UTI or urosepsis
- bleeding disorder or coagulopathy
- pregnancy
- obstruction distal to stone (ESWL can be used after stent or nephrostomy inserted)

Complications

- bacteriuria
- bacteremia
- post-procedure hematuria
- ureteric obstruction (by stone fragments)
- peri-nephric hematoma

A Comparison of Treatment Modalities for Renal Calculi Between 100 and 300 mm²: Are Shockwave Lithotripsy, Ureteroscopy, and Percutaneous Nephrolithotomy Equivalent?

J Endourol 2011;25:481-485

Purpose: To describe the outcomes of a series of patients who underwent shockwave lithotripsy (SWL), ureteroscopy (URS) or percutaneous nephrolithotomy (PCNL).

Methods: Patients treated for intermediate-sized upper tract calculi (100-300 mm²) at a single tertiary centre were included. Demographic and clinical data were collected from a prospectively maintained database.

Results: Of 137 patients, 38.7%, 29.9%, and 31.4% were treated with SWL, URS, and PCNL, respectively. Stone-free rate (95.3%) and single treatment success rate (95.3%) were highest for PCNL compared to SWL and URS (p<0.001). When allowing for up to two SWL treatments, success rates became equivalent for the three treatment groups (p=0.66). Auxiliary treatments were more frequent after SWL compared to URS and PCNL. Clavien grade complications did not differ between the three groups.

Conclusion: Up to two SWL treatments have equivalent success rate as compared to URS and PCNL. Hence, multiple SWL treatments may be a reasonable therapeutic option for patients who prefer SWL or who are not good candidates for alternative therapies.

Common Medications

Table 27. Erectile Dysfunction Medications

Drug	Class	Mechanism	Adverse Effects
sildenafil tadalafil vardenafil (PDE5s for use when some erection present)	Phosphodiesterase 5 inhibitor	Selective inhibition of PDE5 (enzyme which degrades cGMP) Leads to sinusoidal smooth muscle relaxation, increased blood flow and erection	Severe hypotension (very rare) Flushing, headaches, dyspepsia Contraindicated if Hx of priapism, or in conditions predisposing to priapism (leukemia, myelofibrosis, polycythemia, sickle cell disease) Contraindicated with nitrates
alprostadil (MUSE®), PGE ₁ + phentolamine + papaverine mixture	Prostaglandin E ₁	Activation of cAMP, relaxing sinusoidal smooth muscle Local release (urethral suppository)	Penile pain Presyncope
alprostadil, papaverine (intracavernosal injection)	See above	See above	Thickening of tunica albuginea at site of repeated injections (Peyronie's plaque) Painful erection Hematoma Contraindicated if Hx of priapism, or in high risk of priapism
triple therapy also used: papaverine, phentolamine, PGE ₁			

Table 28. Benign Prostatic Hyperplasia Medications

Drug	Class	Mechanism	Adverse Effects
terazosin doxazosin	α_1 blockers	α -adrenergic antagonists reduce stromal smooth muscle tone Reduce dynamic component of bladder outlet obstruction	Presyncope Leg edema Retrograde ejaculation Headache Asthenia Nasal congestion
tamsulosin alfuzosin silodosin	α_{1A} selective		
finasteride dutasteride	5- α reductase inhibitor	Blocks conversion of testosterone to DHT Reduces static component of bladder outlet obstruction Reduces prostatic volume	Sexual dysfunction PSA decreases

Table 29. Prostatic Carcinoma Medications (N>0, M>0)

Drug	Class	Mechanism	Adverse Effects
leuprolide, goserelin "androgen deprivation therapy"	GnRH agonist	Initially stimulates LH, increasing testosterone and causing "flare" (initially increases bone pain) Later causes low testosterone	Hot flashes Headache Decreased libido
*cyproterone acetate	Steroidal antiandrogen	Competes with DHT for intracellular receptors: 1. Prevent flare produced by GnRH agonist 2. Use for complete androgen blockade 3. May preserve potency	
flutamide, bicalutamide	Non-steroidal antiandrogen	As above	Hepatotoxic: AST/ALT monitoring
abiraterone	Non-steroidal antiandrogen	Irreversible CYP17 inhibition, blocking synthesis of androgens in tumour, testis, and adrenal glands	Adrenal insufficiency (concurrent treatment with steroids often required) Hypertriglyceridemia Peripheral edema
enzalutamide	Non-steroidal antiandrogen	Androgen receptor signaling inhibitor (full antagonist)	Peripheral edema Fatigue and weakness Hot flashes

*Very rarely used

Table 30. Continence Agents and Overactive Bladder Medications

Drug	Class	Mechanism	Indication	Adverse Effects
oxybutynin	Antispasmodic	Inhibits action of ACh on smooth muscle Decreases frequency of uninhibited detrusor contraction Diminishes initial urge to void	Overactive bladder Urge incontinence + urgency + frequency	Dry mouth Blurred vision Constipation Supraventricular tachycardia
oxybutynin, tolterodine, trospium, solifenacin, darifenacin, fesoterodine	Anticholinergic	Muscarinic receptor antagonist Selective for bladder Increases bladder volume Decreases detrusor pressure	Overactive bladder Urge incontinence + urgency + frequency	As above
mirabegron	β_3 agonist	Beta sympathetic receptor blocker in the bladder; relaxes bladder during storage phase	Overactive bladder Urge incontinence + urgency + frequency	Blood pressure should be monitored
imipramine	Tricyclic antidepressant	Sympathomimetic effects: urinary sphincter contraction Anticholinergic effects: detrusor relaxation	Stress and urge incontinence	As above Weight gain Orthostatic hypotension Prolonged PR interval
Botulinum toxin A bladder injections	Neurotoxin	Prevents the release of neurotransmitters	Refractory OAB incontinence both neurogenic and non-neurogenic	Urinary retention, UTI

Note: All anti-cholinergics are equally effective and long-acting formulations are better tolerated. Newer muscarinic M3 receptor specific agents (solifenacin, darifenacin) are equally efficacious as older drugs, however, RCTs based on head-to-head comparison to long acting formulations are lacking.

Peripheral Arterial Disease (PAD)

Acute Arterial Ischemia

Definition

- acute occlusion of a peripheral artery, usually without a history of claudication
- urgent management required
 - skeletal muscle can tolerate 6 h of ischemia before irreversible damage and myonecrosis; exception is in acute-on-chronic occlusion, where previously developed collaterals allow more time
- tends to be lower extremity > upper extremity; femoropopliteal > aortoiliac
- paralysis and neuromuscular compromise are signs of late ischemia

Etiology and Risk Factors

- embolism vs. thrombosis
 - examples of conditions that predispose to embolism are: arrhythmias, endocarditis, and arterial aneurysms
 - existing atherosclerotic plaques (i.e. chronic PAD) can rupture causing thrombosis
 - previous vascular grafts/reconstructions can fail and thrombose leading to acute presentation
 - hypercoagulable states can contribute to arterial thrombosis

Clinical Features

Table 1. Arterial Embolism vs. Thrombosis

Presentation	Embolus	Thrombus
Onset	Acute	Progressive, acute-on-chronic
Loss of Function/Sensation	Prominent	Less profound (due to underlying collaterals)
Hx of Claudication	No	Maybe
Atrophic Changes	No	Maybe
Contralateral Limb Pulses	Classically normal	Decreased or absent

Investigations

- history and physical exam are essential: depending on degree of ischemia one may have to forego investigations and go straight to the operating room
- ABI: extension of physical exam, easily performed at bedside
- ECG, troponin: rule out recent MI or arrhythmia
- CBC: rule out leukocytosis, thrombocytosis or recent drop in platelets in patients receiving heparin (may suggest HITS)
- PT/INR, PTT: patient anticoagulated/sub-therapeutic INR
- Echo: identify wall motion abnormalities, intracardiac thrombus, valvular disease, aortic dissection (Type A)
- CT angiogram: underlying atherosclerosis, aneurysm, aortic dissection
- conventional catheter based angiography: can be obtained in OR; prelude to thrombolytics, as part of endovascular intervention or for planning treatment

Treatment

- immediate heparinization with 5000 IU bolus (80 Units/kg) and continuous infusion to titrate PTT to 70-90 s
- if impaired neurovascular status: emergent revascularization
- if intact neurovascular status: time for workup (including angiogram-CTA)
- definitive treatment

Symptoms of Acute Limb Ischemia

- 6 Ps** – all may not be present
- Pain:** absent in 20% of cases
- Pallor:** within a few hours becomes mottled cyanosis
- Paresthesia:** light touch lost first then sensory modalities
- Paralysis/Power loss:** most important, heralds impending gangrene
- Polar/Poikilothermia/‘Perishing cold’**
- Pulselessness:** not reliable

- embolus: embolectomy
- thrombus: thrombectomy ± bypass graft ± endovascular therapy
- irreversible ischemia (complete loss of power or sensation, absent venous and arterial dopplers, rigor): primary amputation
- identify and treat underlying cause
- continue heparin post-operatively, start oral anticoagulant post-operative day 1 x 3 mo depending on underlying etiology

Reperfusion Complications

- compartment syndrome (see [Orthopedic Surgery, OR9](#)) with prolonged ischemia; requires 4-compartment (anterior/lateral/superficial and deep posterior) fasciotomy
- risk of arrhythmia and death with reperfusion injury
- renal failure and multi-organ failure due to toxic metabolites from ischemic muscle

Prognosis

- 12-15% mortality rate
- 5-40% morbidity rate (amputation)

Differential Diagnosis of Claudication

Vascular

- Atherosclerotic disease
- Vasculitis (e.g. Buerger's disease, Takayasu's arteritis)
- Diabetic neuropathy
- Popliteal entrapment syndrome

Neurogenic

- Neurospinal disease (e.g. spinal stenosis)
- Complex regional pain syndrome

MSK

- OA
- Rheumatoid arthritis/connective tissue disease
- Remote trauma

Hypercoagulable States

Congenital

- Group I (reduced anticoagulants)
- Antithrombin
- Protein C
- Protein S
- Group II (increased coagulants)
- Factor V Leiden
- Prothrombin
- Factor VIII
- Hyper-homocysteinemia

Acquired

- Immobility
- Cancer
- Pregnancy/Systemic hormonal contraceptives/HRT
- Antiphospholipid antibody syndrome
- Inflammatory disorders (e.g. IBD)
- Myeloproliferative disorders (e.g. ET)
- Nephrotic syndrome (acquired deficit in Protein C and S)
- DIC
- HIT

Chronic Arterial Occlusion/Insufficiency

Definition

- chronic ischemia due to inadequate arterial supply to meet cellular metabolic demands (during walking (claudication) or at rest (limb threat/critical limb ischemia))

Etiology and Risk Factors

- predominantly due to atherosclerosis (for pathogenesis, see [Cardiology and Cardiac Surgery, C26](#)); primarily occurs in the lower extremities
- major risk factors: smoking, DM, older age
- minor risk factors: HTN, hyperlipidemia, obesity, sedentary lifestyle, PMHx or FMHx CAD/CVD

Clinical Features

- claudication: must differentiate vascular from neurogenic claudication or MSK
 1. pain with exertion: usually in calves or any exercising muscle group
 2. relieved by short rest: 2-5 min, and no postural changes necessary
 3. reproducible: same distance or time to elicit pain, same location of pain, same amount of rest to relieve pain
- critical limb ischemia (CLI)
 1. includes rest pain, night pain, tissue loss (ulceration or gangrene)
 2. pain most commonly over the forefoot, waking person from sleep, and often relieved by hanging foot off bed
 3. ankle pressure <40 mmHg, toe pressure <30 mmHg, ABI <0.40
 - ♦ pulses may be absent at some locations, bruits may be present
 - ♦ signs of poor perfusion: hair loss, hypertrophic nails, atrophic muscle, ulcerations and infections, slow capillary refill, prolonged pallor with elevation and rubor on dependency, venous troughing (collapse of superficial veins of foot)

Investigations

- non-invasive
- routine blood work, fasting metabolic profile
- ABI: take highest brachial and highest ankle (dorsalis pedis artery or posterior tibial artery) pressures for each side generally (see Table 2) (may be falsely normal or elevated in those with calcified vessels e.g. diabetics)
- CTA and MRA
 - excellent for large arteries (aorta, iliac, femoral, popliteal) but may have difficulty with tibial arteries (especially in the presence of disease)
 - require IV injection of nephrotoxic contrast (iodinated contrast for CT, gadolinium for MR)
 - used primarily for planning interventions
- invasive
 - arteriography: superior resolution to CTA/MRA, better for tibial arteries, can be done intraoperatively or as part of endovascular intervention

Table 2. Ankle-Brachial Indices

ABI Recording	Degree of Ischemia
>1.20	Suspect wall calcification (most common in diabetics)
>0.95	Normal/no ischemia
0.50-0.80	Claudication range
<0.40	Possible critical ischemia

Treatment

- conservative
 - risk factor modification (smoking cessation, HbA1c control, treatment of HTN, hyperlipidemia (statin), antiplatelet therapy [ECASA])
 - exercise program (30 min 3x/wk): improves collateral circulation and oxygen extraction at the muscle level
 - foot care (especially in DM): keep wounds clean/dry, avoid trauma and pressure on wounds
- pharmacotherapy
 - antiplatelet agents (e.g. ECASA, clopidogrel)
 - cilostazol (cAMP-phosphodiesterase inhibitor with antiplatelet and vasodilatory effects): improves walking distance for some patients with claudication (not available in Canada)
- surgical/endovascular
 - indications: severe lifestyle impairment, vocational impairment, critical ischemia
 - revascularization
 - ♦ endovascular (angioplasty ± stenting)
 - ♦ endarterectomy: removal of plaque and repair with patch (usually distal aorta or common/profunda femoral)
 - ♦ bypass graft sites: aortofemoral, axillofemoral, femoropopliteal, distal arterial – graft choices: vein graft (reversed or in situ), synthetic (polytetrafluoroethylene graft (e.g. Gore-Tex®) or Dacron®)
 - ♦ amputation: if not suitable for revascularization, persistent serious infections/gangrene, unremitting rest pain poorly controlled with analgesics

Prognosis

- claudication: conservative therapy: 60-80% improve, 20-30% stay the same, 5-10% deteriorate, 5% will require intervention within 5 yr, <4% will require amputation
- for patients with CLI, at 2 yr: 25% risk of mortality, 25% risk of bilateral limb amputation, 25% risk of unilateral limb amputation, 25% without complications. 33% 5 yr survival rate

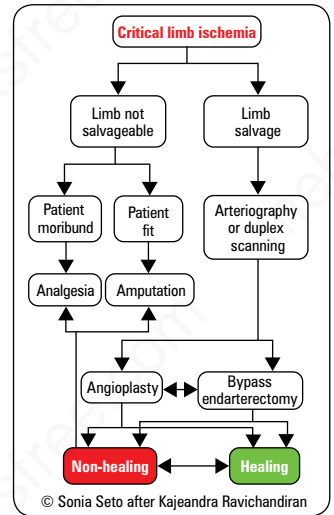

Figure 1. Treatment options for CLI
 Modified from Beard JD. Chronic lower limb ischemia. *BMJ* 2000;320:854-857

Aortic Disease

Aortic Dissection

Definition

- tear in aortic intima allowing blood to dissect into the media
- Stanford classification: Type A (involve the ascending aorta) vs. Type B (do not)
- acute <2 wk (initial mortality 1% per hr for Type A dissections)
- chronic >2 wk

Etiology

- most common: HTN
- other: connective tissue disease (e.g. Marfan's, Ehlers-Danlos), cystic medial necrosis, atherosclerosis, congenital conditions (e.g. coarctation of aorta, bicuspid aortic valves, patent ductus arteriosus), infection (e.g. syphilis), trauma, arteritis (e.g. Takayasu's)

Epidemiology

- M:F = 3:1
- small increased incidence in African-Canadians (related to higher incidence of HTN); lowest incidence in Asians
- peak incidence 50-65 yr old; 20-40 yr old with connective tissue diseases

Clinical Features

- sudden onset chest pain that radiates to back with:
 - hypertension with asymmetric BPs and pulses between arms (>30 mmHg difference indicates poor prognosis)
 - ischemic syndromes due to occlusion of aortic branches: coronary (MI), carotids (ischemic stroke, Horner's syndrome), splanchnic (mesenteric ischemia), renal (AKI), peripheral (ischemic leg), intercostal vessels (spinal cord ischemia)
 - "unseating" of aortic valve cusps (new diastolic murmur in 20-30%) in Type A dissection
 - rupture into pleura (dyspnea, hemothysis) or retroperitoneum (hypotension, shock) or pericardium (cardiac tamponade)
 - syncope
 - aortic dissection is considered a 'great imitator' of other conditions, thus increased risk to patient and MD (medicolegal)

Investigations

- CTA is the mainstay of both diagnosis and determining the extent of dissection
- ECG and troponin to rule out other causes: (LVH ± ischemic changes, pericarditis, heart block)
- CXR: pleural cap (pleural effusion in lung apices), widened mediastinum, left pleural effusion with extravasation of blood
- TEE: can visualize aortic valve and thoracic aorta but not abdominal aorta
- consider: lactate (elevated in ischemic gut, shock), amylase (rule out pancreatitis), troponin (rule out MI)

Figure 2. Stanford classification of aortic dissection

Treatment

- Type A dissection needs referral to cardiac surgeon for urgent repair
 - resection of segment with intimal tear; reconstitution of flow through true lumen; replacement of the affected aorta with prosthetic graft
 - post-operative complications: renal failure, intestinal ischemia, stroke, paraplegia, persistent leg ischemia, death
 - 2/3 of patients die of operative or post-operative complications
 - initial mortality rate without surgery is 3% per hr for first 24 h, 30% 1 wk, 80% 2 wk
- Type B dissection is managed medically
 - acute therapy is typically with intravenous antihypertensives titrated to BP measured by arterial line in critical care setting
 - may transition to oral meds after initial control
 - β -blocker to lower BP and decrease cardiac contractility (nondihydropyridine CCB if clear contraindications to β -blockers)
 - ACEI and/or other vasodilators if insufficient BP or HR control
 - selective intervention (endovascular or surgical) for complications or refractory symptoms/progression despite medical therapy
 - may be a subset of patients who could be well treated with early aortic stent-grafting after initial medical stabilization – evolving area of the literature

Aortic Aneurysm

Definition

- localized dilatation of an artery having a diameter at least 1.5x that of the expected normal diameter
- true aneurysm: involving all vessel wall layers (intima, media, adventitia)
- false aneurysm (also known as pseudo-aneurysm): disruption of the aortic wall or the anastomotic site between vessel and graft with containment of blood by a fibrous capsule made of surrounding tissue
- aneurysms can rupture, thrombose, embolize, erode, and fistulize

Classification

- thoracic aortic aneurysm (TAA): ascending, transverse arch, descending
- thoracoabdominal
- abdominal aortic aneurysm (AAA): 90-98% are infrarenal
- suprarenal: involves one or more visceral arteries, but does not involve the chest
- pararenal: renal arteries arise from aneurysmal aorta, but the SMA origin is not aneurysmal
- juxtarenal: the renal arteries originate from normal aorta, but are immediately adjacent to aneurysmal aorta (there is no nonaneurysmal aorta distal to the origin of the renal arteries)
- infrarenal: the aneurysm originates distal to the renal arteries (there is nonaneurysmal aorta distal to the origins of the renal arteries)

Etiology and Risk Factors

- risk factors: smoking, HTN, PVD, CAD, CVD, age >70, family history
- degenerative
- traumatic
- mycotic (*Salmonella*, *Staphylococcus*, usually suprarenal aneurysms)
- connective tissue disorder (Marfan syndrome, Loeys-Dietz Syndrome, Ehlers-Danlos syndrome)
- vasculitis
- infectious (syphilis, fungal)
- ascending thoracic aneurysms are associated with bicuspid aortic valve

Clinical Features

- 75% asymptomatic
- most commonly in the abdominal aorta
- common presentation: due to acute expansion or rupture
 - syncope
 - pain (chest, abdominal, flank, back)
 - hypotension
 - palpable pulsatile mass above the umbilicus
 - airway or esophageal obstruction, hoarseness (left recurrent laryngeal nerve paralysis), hemoptysis, or hematemesis (indicates thoracic or thoracoabdominal aortic aneurysm)
 - distal pulses may be intact

Investigations

- blood work: CBC, electrolytes, urea, creatinine, PTT, INR, type and cross
- abdominal U/S (approaching 100% sensitivity, up to ± 0.6 cm accuracy in size determination) – useful for screening and surveillance
- CT with contrast (accurate visualization, size determination, EVAR planning)
- peripheral arterial doppler/duplex (rule out aneurysms elsewhere, e.g. popliteal)

ACC/AHA 2005 Guidelines define an AAA when the minimum AP diameter of abdominal aorta ≥ 3.0 cm

Figure 3. Classification of aneurysms

Classic Triad of Ruptured AAA

- Hypotension/collapse
- Back/abdominal pain
- Palpable, pulsatile abdominal mass (caution in patients with raised BMI)

CCS PAD Guidelines 2006 Recommend AAA Screening Among:

- Men aged 65-74 yr
- Women aged 65 yr with cardiovascular disease and positive family history of AAA
- Men aged 50 yr and above with a positive family history

Treatment

- conservative (for asymptomatic aneurysms that do not meet the size threshold for repair)
 - cardiovascular risk factor reduction: smoking cessation; control of HTN, DM, hyperlipidemia, regular exercise, watchful waiting, U/S surveillance with frequency depending on size and location
- surgical
 - indications
 - ruptured
 - symptomatic
 - size >5-5.9 cm
 - ascending thoracic aortic aneurysms
 - symptomatic, enlarging, diameter >6 cm or >2x normal lumen size, >4.5 cm and aortic regurgitation (annuloaortic ectasia); ≥4.5-5 cm in Marfan syndrome
 - risk of rupture depends on: size, family history of rupture, rate of enlargement (>1 cm/yr in diameter), symptoms, and comorbidities (HTN, COPD, dissection), smoking
 - elective AAA repair mortality 2-5% for open repair (1-2% for EVAR); elective TAA repair mortality <10% (highest with proximal aortic and thoracoabdominal repairs)
 - surgical options
 - open surgery (laparotomy or retroperitoneal) with graft replacement
 - complications
 - early: renal failure, spinal cord injury (paraparesis or paraplegia), impotence, arterial thrombosis, anastomotic rupture or bleeding, peripheral emboli
 - late: graft infection/thrombosis, aortoenteric fistula, anastomotic (pseudo) aneurysm
 - endovascular aneurysm repair (EVAR)
 - newer procedure; high success rates in patients with suitable anatomy
 - advantages: preferred to open surgery in ruptured AAA for patients with suitable anatomy, decreased morbidity and mortality, procedure time, need for transfusion, ICU admissions, length of hospitalization, and recovery time
 - disadvantages: endoleak rates as high as 20-30%, device failure increasing as longer follow-up periods are achieved, re-intervention rates 10-30%, cost-effectiveness is an issue, radiation exposure (especially in younger patients due to need for life-long follow-up)
 - complications
 - early: immediate conversion to open repair (<1%), groin hematoma, arterial thrombosis, iliac artery rupture, and thromboemboli
 - late: endoleak, graft kinking, migration, thrombosis, rupture of aneurysm

Carotid Stenosis

Definition

- narrowing of the internal carotid artery lumen due to atherosclerotic plaque formation, usually near common carotid bifurcation into internal and external carotids

Risk Factors

- for atherosclerosis: HTN, smoking, DM, CVD or CAD, dyslipidemia, older age

Clinical Features

- may be asymptomatic
- if symptomatic - hemispheric or ocular presentation

Investigations

- CBC, PT/INR, PTT (hypercoagulable states)
- fundoscopy: cholesterol emboli in retinal vessels (Hollenhorst plaques)
- auscultation over carotid bifurcation for bruits (do not correlate with degree of stenosis)
- carotid duplex: determines severity of disease (mild/moderate/severe stenosis or occlusion) ± cross sectional imaging with CT or MR

Treatment

- risk factor modification for all patients to control HTN, lipids, DM
- pharmacological - antiplatelet agents (ASA ± dipyridamole, clopidogrel) ~25% relative risk reduction
- surgical - carotid endarterectomy (generally if symptomatic and >70% stenosis) or endovascular angioplasty ± stenting

Prevention of Disabling and Fatal Strokes by Successful Carotid Endarterectomy in Patients Without Recent Neurological Symptoms: Randomized Controlled Trial

Lancet 2004;363:1491-1502

Study: Asymptomatic Carotid Surgery Trial (ACST), a RCT with follow-up at 5 yr.

Patients: 3,120 asymptomatic patients with significant carotid artery stenosis were randomized equally between immediate carotid endarterectomy (CEA) and indefinite deferral of CEA and were followed for up to 5 yr (mean 3.4 yr).

Main Outcome: Any stroke (including fatal or disabling).

Conclusions: In asymptomatic patients with significant carotid artery stenosis, immediate CEA reduced the net 5-yr stroke risk from about 12% to about 6%. Half of this 5 yr benefit involved disabling or fatal strokes.

Peripheral Venous Disease

Deep Venous Thromboembolism

- see [Hematology, H35](#)

Varicose Veins

Definition

- distention of tortuous superficial veins resulting from incompetent valves in the deep, superficial, or perforator systems

Etiology

- primary (99% of cases) varicosities: venous valve incompetence or obstruction
 - contributing factors: increasing age, systemic hormonal contraceptive use, prolonged standing, pregnancy, obesity
- secondary varicosities: DVT, malignant pelvic tumours with venous compression, congenital anomalies, arteriovenous fistulae, trauma

Epidemiology

- primary varicose veins are the most common form of venous disorder of lower extremity
- 65% of north American adult population gets some degree of venous insufficiency

Clinical Features (often the degree of symptoms do not correlate with the clinical findings)

- diffuse aching, fullness/tightness, nocturnal cramping
 - aggravated by prolonged standing (end of day), premenstrual
- visible long, dilated and tortuous superficial veins along thigh and leg (great or small saphenous veins and tributaries)
- ulceration, hyperpigmentation, and induration (i.e. lipodermatosclerosis)

Complications

- recurrent superficial thrombophlebitis/superficial vein thrombosis
- features of chronic venous insufficiency: ulceration, eczema, lipodermatosclerosis, stasis dermatitis and hyperpigmentation
- bleeding or hematoma secondary to trauma

Treatment

- largely a cosmetic problem
- conservative: elastic compression stockings
- indications for surgery: failure of conservative treatment, symptomatic varix (pain, bleeding, recurrent thrombophlebitis), tissue changes (hyperpigmentation, ulceration), cosmetic
- surgical: high ligation and stripping of the long saphenous vein and its tributaries, ultrasound-guided foam sclerotherapy, endovenous laser therapy
- 10 year post-operative recurrence of 20%

Chronic Venous Insufficiency

Definition

- venous insufficiency and skin damage

Etiology

- calf muscle pump dysfunction and valvular incompetence (reflux) due to phlebitis, varicosities, or DVT
- venous obstruction

Clinical Features

- pain (most common), ankle and calf edema – relieved by foot elevation
- pruritus, brownish hyperpigmentation (hemosiderin deposits)
- stasis dermatitis, subcutaneous fibrosis if chronic (lipodermatosclerosis)
- ulceration: shallow, above medial malleolus, weeping (wet), painless, irregular outline
- signs of DVT/varicose veins/thrombophlebitis

Investigations

- not required if conservative treatment only
- Doppler U/S (most commonly used in pre-operative assessment)

Treatment

- conservative
 - elastic compression stockings, ambulation, periodic rest-elevation, avoid prolonged standing
 - ulcers: multilayer compression bandage, antibiotics prn
- surgical
 - if conservative measures fail, or if recurrent/large ulcers to reduce the risk of recurrence
 - surgical ligation of perforators in region of ulcer (GSV/LSV ligation and stripping)
- endovenous: laser or radiofrequency ablation, or foam sclerotherapy

Lymphedema

Definition

- obstruction of lymphatic drainage resulting in edema with high protein content

Etiology

- primary
 - Milroy's syndrome: congenital hereditary lymphedema
 - lymphedema praecox (75% of cases): starts in adolescence
 - lymphedema tarda: starts >35 yr
- secondary
 - infection: filariasis (#1 cause worldwide)
 - malignant infiltration: axillary, groin or intrapelvic
 - radiation/surgery (axillary, groin lymph node removal): #1 cause in North America

Clinical Features

- classically non-pitting edema
- impaired limb mobility, discomfort/pain, psychological distress

Treatment

- avoid limb injury (can precipitate or worsen lymphedema)
- cellulitis: treat early to avoid further lymphatic damage
- skin hygiene
 - daily skin care with moisturizers
 - early medical assessment and treatment for infection (topical for fungal infection; systemic for bacterial infection)
- external support
 - intensive: compression bandages
 - maintenance: compression garment
- exercise
 - gentle daily exercise of affected limb, gradually increasing ROM
 - must wear a compression sleeve/bandages when doing exercises
- massage: manual lymph drainage therapy

TORONTO NOTES 2 18

COMPLETE, CONCISE, AND UP-TO-DATE INFORMATION

For 34 years, Toronto Notes has been a premier study resource for the Canadian MCCQE and USMLE Step II medical licensing exams. This edition provides concise and comprehensive information on the objectives covered by these exams, including the most recent best practice guidelines and up-to-date trials for clinical practice. Toronto Notes is an excellent resource for clinical rotations and this text contains 31 subject-specific chapters:

Anesthesia and Perioperative Medicine
Cardiology and Cardiac Surgery
Clinical Pharmacology
Dermatology
Emergency Medicine
Endocrinology
Ethical, Legal, and Organizational Medicine
Family Medicine
Gastroenterology
General Surgery and Thoracic Surgery
Geriatric Medicine
Gynecology
Hematology
Infectious Diseases
Medical Genetics
Medical Imaging
Nephrology
Neurology
Neurosurgery
Obstetrics
Ophthalmology
Orthopedics
Otolaryngology
Pediatrics
Plastic Surgery
Population Health and Epidemiology
Psychiatry
Respirology
Rheumatology
Urology
Vascular Surgery
